OS/2, Unix facing net clash

Server strategies straddle fence while technical issues are resolved

BY ELISABETH HORWITT and JOANIE M. WEXLER CWSTAFF

They are just starting to square off now, but within a year or two, OS/2 and Unix should be engaged in a head-to-head struggle for control of Fortune 500 companies' local-area network server budgets.

Personal computer LAN products represented a \$4.6 billion market worldwide in 1989, according to a recent report by Salomon Brothers, Inc. That total is projected to grow 21% this year, with high-end server and operating system sales making up the bulk of the growth.

The 21-year-old Unix operating system seems to command a strong technical position today as a far more mature operating system with the built-in networking and maintenance utilities that 2-year-old OS/2 lacks. But several users said they expect OS/2 to catch up with Unix in most key areas within a year or two - when many companies will still be in the evaluation stage of their long-term network server strategies.

World Bank, for example, hopes to put together within a few years an "architectural framework for computing and communications," which will probably include both OS/2 and Unix, according to senior research officer David Delmonte.

Currently, the bank uses Unix-based servers from Banvan Systems, Inc., but "it would be premature for us to move wholesale" into any kind of corporatewide server architecture, Delmonte said. He cited the current immature state of key technologies in both the Unix and OS/2 worlds, including LAN shared SQL management.

PS/2 tries to climb off desktop

BY RICHARD PASTORE

NEW YORK - IBM, which has been eating dust in the file server race, hopes to gain ground with six new Personal System/2 models introduced last week.

The models range from two entry-level Model 65 SXs to four improved Model 80s. IBM's most powerful PS/2s to date (see chart page 8). The boxes will support up to 254 nodes when running IBM's LAN Server 1.2 software. However, the 65 SX is better suited for less computingintensive local-area networks, while the Model 80 is the family's workhorse.

All of the systems feature the small computer systems interface, which allows attachment of up to seven peripheral devices per SCSI board. This is a key new strategy that may make its server offerings more attractive and competitive, observers said.

Being able to put multiple drives on a server creates more flexible options for the user," according to Bruce Stephen, an analyst at market research firm

Covia eyeing tiered LANs

BY ELISABETH HORWITT

ENGLEWOOD, Colo. - Covia Partnership effectively issued a testimonial to OS/2's viability as a server architecture recently by deciding to make OS/2 and LAN Manager the basis for the server platform it developed to serve its airport and travel agency users.

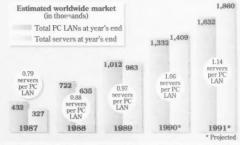

But while Covia has concluded that OS/2 has the power and networking support to serve high-end local-area network systems of 1.000 stations or more. the airline service firm is leaning toward Unix when it comes to implementing the crucial next stage of its server strategy.

Covia is looking to cut costs and provide more efficient use of computing resources, both for itself and its airport and travel agency clients, through powerful hubs that will supply the application, data and interconnectivity needs of entire regions, said Covia Chief Information Officer and Vice-President Mark Teflian.

In this instance, a "region" could be a group of travel agents Continued on page 128

he firms that will make it in the '90s are those that focus on what they do best and outsource the rest, according to an article in the latest Harvard Business Review. The report results from a three-year study that measures technology's impact on the service sector. Outstanding examples: Toys 'R Us thrives by knowing so much about the toy market that it even directs its own suppliers' production plans. Apple made it big by farming out everything from hardware to marketing and focusing its own energies on innovation. Honda built its automotive empire by building great engines and outsourcing nonengine fabrication work.

Converting obsolete IS systems may require pulling out the heavy equipment. Page 97.

EXECUTIVE BRIEFING

- Between the EDI proponents and naysayers, there may not seem to be a middle ground. But implementing EDI does not have to be an all-or-nothing effort. Some companies are using a personal computer-based setup to keep it small; others are going whole-hog, paying bills electronically and transmitting other data beyond ordering and invoicing, such as bar-coding and CAD/CAM. Be warned that there is a lot of homework involved. Get to know your firm's requirements, network needs, commercial software offerings and the services of the third-party providers. Page 81.
- The choice may be between OS/2 and Unix, and if you are an IS manager who wants to know which is better suited for a networked environment, the answer is unclear. Interviews with users and consultants show that Unix holds an edge over OS/2 as the platform of choice for servers, but that OS/2 is likely to close the gap and make it a real horse race during the next couple of years as developers in both worlds flesh out their network capabilities. IBM tried to fill in some missing pieces last week when it announced that OS/2 Extended Edition Version 1.2 and LAN Server will ship this week. IBM also introduced a batch of new Personal System/2 models, including some designed to be servers. Stories pages 1, 8 and 128.
- This decade is going to hurt, according to a poll of 112 senior IS executives questioned by Arthur D. Little, Inc. The managers said they expect "high" to "excruciating" levels of pain as their companies transform the way they use information and do business during the next decade. Page 73.
- Everyone is talking about globalization and its role in the business world of the 1990s. For one business segment electronics globalization means that organizations will not only be looking for worldwide market opportunities, but also for competition and capital. Page 105.
- There has been another security breach on the Internet network, which was victimized by a worm program more than a year ago. This time a hacker tried to show up some of the computer experts who have criticized hackers and virus-mongers. Page 127. Meanwhile, the specter of criminal charges may come to haunt information systems managers who fail to secure their systems against viruses, hackers and other threats. Security experts say that a serious com-

- puter problem that causes a company to go bankrupt or harms employees could leave the IS manager holding the bag. Page 1.
- Merger mania has altered the lives of numerous IS professionals, but in California, there is an IS organization that has had to sit and watch a system die a painful death because of the lack of a merger. San Diego Gas & Electric Co.'s plans for a new energy control system have been on hold for two years because a proposed merger has been frozen. Page 29.
- On-site this Northwest Airlines hopes to empty a gymnasium-size room of maintenance documents with the help of an online system. Page 29. Computerized tally dillydally

Standard for voting systems integrity is much too wishy-washy, experts say

BY MITCH BETTS

WASHINGTON, D.C. - Severcomputer scientists have sharply criticized a new technical standard for computerized votecounting systems and argued that tougher standards are needed to ensure the accuracy of U.S. vote tallies.

Critics said the standard, approved by the Federal Election Commission (FEC), is deficient in the areas of software testing, programming languages and

computer security.
"The result is a gossamer standard, so thin and flimsy that it will do little to improve the security and integrity of electronic elections," according to a critique by Howard Jay Strauss, a Princeton University computer scientist and member of a citigroup called Election zens

The controversy concerns a voluntary standard written by the FEC's National Clearinghouse on Election Administration for use by state and local election officials [CW, Jan. 29]. The standard calls for certification of computer systems by independent testing authorities, audit trails and placement of vote-counting software in escrow so it can be checked in disputed elections.

"It's a good start, but I'm dis-appointed with the standard in several areas," said Roy J. Saltman, a computer scientist at the National Institute of Standards

and Technology and the federal government's top expert on voting systems.

Saltman and Election Watch cited the following deficiencies: • The use of high-order programming languages, such as Cobol, C and Ada, is suggested but is not mandatory. Experts said it is difficult to spot hidden code in the assembler language now used in vote-counting software programs.

• The use of dedicated systems for vote counting also is suggested but not mandated. Using a computer dedicated only to votecounting prevents the software from being contaminated or altered by other computer programs running on the same sys-

· Much of the standard relies on the vendors of voting systems to ensure computer security. For example, vendors are to perform the penetration analysis on their own systems and send the results to the testing authority, but not to the election administrators.

'What's the whole point [of independent certification] you're going to accept the word of vendors?" Saltman said.

• The standard allows the continued use of prescored punch card ballots, which are notorious for having the chad fall out during handling and processing.

'In most places, the standard accepts the status quo. In others, it artfully protects vendors from

any real change," Strauss said. Robert J. Naegele, a San Jose, Calif.-based consultant who wrote early drafts of the standard, said he is not happy with the final product. He said that the approved standard is poorly organized, lacks technical clarity and should have made dedicated systems and high-order pro-

gramming languages mandatory for new voting systems.

In defense of the standard, Penelope S. Bonsall, director of the FEC clearinghouse, said it is the result of pragmatic compromises between the interests of computer specialists, state and local election officials and ven-

For example, she agreed that dedicated systems for vote tabulation are ideal from the point of view of "computer security purists," but many small jurisdictions do not have the funds for dedicated systems.

Bonsall said that high-order programming languages were not required because of the cost of rewriting the software for little benefit. She added that outlawing prescored punch cards or regulating the voting machine industry is beyond the FEC's au-

Bonsall defended the decision to prevent users from obtaining the vendor's system-penetration analysis on grounds that public disclosure would show hackers where the system is vulnerable.

"That's ridiculous," Saltman countered. "If there are vulnerabilities, the jurisdictions should know about it." They could keep the analysis out of public hands, he said.

The next step in the process is accreditation of the indepen-dent testing laboratories. "They don't have any money for that," Saltman said. "Let's hope they find some."

U.S. computer technology finally comes to its census

BY GARY H. ANTHES

The U.S. Bureau of the Census, which kicked off the 1990 census by mailing questionnaires to millions of American households last week, is counting on an array of new computer technologies to make the \$2.5 billion count more accurate and timely.

The bureau will also publish its results in a format intended to make machine-readable census data widely available to cost-conscious individuals and small businesses for the first time.

The Census Bureau seems to mark major progress in 100-year increments. For the first U.S. census, conducted in 1790, some 650 assistant U.S. marshals counted four million Americans at a cost of \$44,000. The technological underpinnings included horses and quill pens.

For the 1890 count, census engineer Herman Hollerith developed an automatic cardpunching machine, which vastly accelerated the processing. Hollerith later left the Census Bureau to start a company that eventually became IBM.

This century, quill pens and punched cards are out. The monumental task of counting 250 million U.S. citizens is backed by 530 Digital Equipment Corp. VAXs, 6,900 terminals, 74 custom-built high-speed cameras for turning census forms into microfilm, several Unisys Corp. mainframes for number-crunch-

ing and reporting and a gaggle of output devices for preparing gigabytes of data for the public.

The agency said it will interview 2.2 million people for 480,000 temporary jobs, boosting its

staff to more than 50 times the usual number.

The Constitution requires a census to be taken at least once every 10 years, and subsequent legislation has put a variety of reporting demands on the Census Bureau

To help it meet these escalating requirements, the bureau will unveil several new automated aids this year. Chief among them is the \$300 million TIGER

The Topologically Integrated Geographic Encoding and Referencing system replaces the error-prone method of preparing maps manually. In 1980, many thousands of map sheets - used by an army of field enumerators were laboriously prepared, coded, corrected and distributed. Many turned out to be illegible and incorrect [CW, June 12].

Now, electrostatic plotters in regional offices are printing 1.7 million unique map sheets from a digital cartographic database supplied by the U.S. Geological

Survey, with features such as roads annotated or labeled by the Census Bureau. Between now and the census of the year 2000, the agency will continue to update the database and will sell its map

data to the public.

7 8 9 X

4 5 6 ÷

1 2 3

0

Another bottleneck in previous counts has been at the front end of the enormous data-capture exercise. The process of logging in census forms and then determining which were missing was largely a manual one. This year, each form will bear a bar code identifying the address to which it is mailed.

In another improvement. Bureau programmers have added "smart" software that is able to assign codes to text that is entered from those few portions of the census forms that allow handwritten entries.

For example, a spokeswoman for the bureau said, American Indians are asked to write in the names of their tribes. Edit programs will then assign codes to the tribe names, facilitating processing and reporting. The processing of census data

has been greatly decentralized for the 1990 count. The district offices previously relied entirely on manual processing of incoming census forms. Now, the district offices have DEC Microvax 3500s connected to devices for scanning the bar codes. The new procedures should get data into the system months earlier, census officials said.

For the 1980 census, the Census Bureau published some 900 reports on paper and sold the 5.5 gigabytes of supporting data on magnetic tapes. Starting with this census, the agency will sell its data on compact disc/ read-only memory disks for systems as small as personal com-

The Census Bureau predicted that printed output of all the 1990 census data would fill some 420,000 pages, or 62 feet of shelf space. The official report from the first U.S. census 200 years ago was 56 pages.

Closing Arguments

Only ORACLE supports virtually every vendor's software, hardware and network.

Today, some software companies claim that their software products are "open." They may even graft the word onto their product names. It is a confusing situation, but a clear definition of "open" is finally emerging.

Software is "open" only if it adheres to industry standards and works with products from other

vendors.

OPENIAR CHIEFCIURE VERY GIVEN TO THE TOTAL TO THE TOTAL TO THE TOTAL TO THE TOTAL TO

specifically, a database is open if it works with other vendors' databases. For example, ORACLE provides access to IBM's DB2, SQL/DS and DEC's RMS.

An open database should also work with other vendors' applications. ORACLE works with DEC's All-in-1, DG's CEO, IBI's Focus and SAS. And it supports PC software like Lotus 1-2-3, WordPerfect, Borland's Paradox and Apple's Hypercard. Even Dbase applications run on ORACLE.

Software is open if it runs on every vendor's operating system. ORACLE runs on MS-DOS, OS/2, Mac OS, UNIX, VMS, MVS and virtually every other operating system on the market.

And software is open if it supports every vendor's network. ORACLE supports IBM's LU6.2, LAN Manager, NetBIOS, DECnet, Novell's SPX/IPX, industry standard X.25 and TCP/IP and many others.

Choosing open software today lets users choose any vendor's hardware, software and network tomorrow.

NEWS SHORTS

Now it's enterprise licensing

Informix Software, Inc. will let corporations buy enterprisewide licenses for its Wingz spreadsheet and Smartware II office automation software packages. The move follows Microsoft Corp.'s introduction of site-licensing for some of its products, including the Excel spreadsheet, which competes with Wingz. "This goes beyond a site license," said David Frankland, director of channel marketing at Informix. "We don't want to put any geographic limitation on it." Customers can buy documentation in lots of 25 and distribute the software to 250 or more users. Frankland said Liberty Mutual Insurance Co. has purchased an enterprisewide license for Wingz.

Store-and-forward advances

Compuserve, Inc. said last week that it had interconnected its electronic mail system with Action Technologies, Inc.'s Message Handling Service (MHS), a message management and handling system supported by some two-dozen software vendors. Compuserve said the interconnection will allow the 553,000 members of the Compuserve Information Service to link with the 750,000 users of MHS-compatible local-area network mail systems. Action also announced an agreement under which Ashton-Tate Corp. will license MHS for its Framework III and Multimate 4.0 software.

Sharp adds notebook computer

Sharp Corp. last week introduced the PC-6220, its new four-pound notebook personal computer. The PC runs on a 12-MHz Intel Corp. 80C286 microprocessor and has a 24-line LCD screen with IBM Video Graphics Array emulation and a triple supertwist display. The system comes with 1M byte of random-access memory, expandable to 3M bytes. It is equipped with a 24-in., 20M-byte hard disk. The Sharp laptop does not have a floppy disk drive, but an optional 3½-in. floppy disk can be attached. It was also designed to be converted into an IBM Personal Computer AT-compatible desktop system. Sharp said the PC will retail for less than \$4,000.

CA adds on-line access

Computer Associates International, Inc. last week took steps toward burnishing its lackiuster service and support reputation by announcing a no-cost, on-line service for accessing temporary program fixes and product information bulletins. The new service, called CA-PTFAID, will allow companies with CA software maintenance agreements to dial into CA's customer service system via a dial-up terminal or PC and review fixes and product information bulletins.

Farallon connector down pat

A U.S. patent for the connector that reportedly first allowed users to network computers over existing telephone wires was recently awarded to Farallon Computing, Inc. The company said it is interested in negotiating licensing agreements to third-party manufacturers of connecting devices.

Symbolics unwraps HDTV box

Chalk one up for the U.S. in the high-definition television contest. Symbolics, Inc. last week unveiled what it said will be the first commercially available high-definition videographics processor, called Flame Thrower. The firm also announced a high-definition videographics workstation. The technology does not come cheaply: The processor sells for \$23,900, and the workstation costs \$58,000. Both are expected to ship in June.

Contel wins Tass pact

The Contel ASC subsidiary of Contel Corp. last week won a \$3 million contract from Tass, the Soviet news agency, to provide a satellite-based network. Tass will use the private network to exchange news dispatches with bureaus inside the USSR and abroad. The network will support data broadcast and two-way exchanges of data, facsimile and voice at 9.6K bit/sec., 10 times faster than with the existing system, Contel said.

Boeing exec fills Microsoft pilot seat

Boeing Computer's Hallman to replace retiring President Shirley

BY CHARLES VON SIMSON

REDMOND, Wash. — Ending an executive search with a broad focus outside the personal computer segment of the industry, Microsoft Corp. last week tapped the president of Boeing Computer Services as its No. 2 executive.

Michael R. Hallman will join Microsoft as president April 2, replacing retiring President Jon A. Shirley. He brings to the job 25 years of experience gained at both Boeing and IBM in selling into large corporate computer accounts. That experience may prove critical as Microsoft struggles for the acceptance of OS/2.

"We needed someone with big-company experience, and there are not a lot of billion-dollar companies in the PC business," said Shirley, who will leave his position June 30. In light of Microsoft Chairman Bill Gates' profile, Shirley said, "we didn't need a big name."

Hallman, 44, became president of Boeing Computer Services in November 1987 and was responsible for all Boeing com-

puting and communications systems, managing an inventory with an estimated value of \$1.3 billion, including 43,000 PCs.

Prior to joining Boeing, Hallman spent 20 years in various

Hallman to take Microsoft's second spot in April

marketing positions at IBM, most recently as vice-president of field operations, responsible for all sales and marketing support for the company's Southwest marketing division.

He is likely to continue in Shirley's role of playing the inside man to Gates' strong outside presence. "Why change what has been a successful formula?" Shirley asked. "While we are not the same person, and there will be differences, Mike has depth in similar areas."

Executives who know Hallman said he made his reputation at IBM as an effective salesman in the lucrative General Motors Corp. account in the mid-1970s. He moved through several prominent positions in the firm but failed to gain the presidency of the Southwest marketing division. At that point, he went to Boeing and served as the deputy to the former Boeing Computer Services President Robert Dryden, who went on to a senior general management position at the aerospace giant, leaving the job to Hallman.

Hallman is an able operations manager and aggressive marketer, according to several sources, continuing in the model of Shirley. "Much in the same way as Shirley, Hallman's business and sales strengths will play to Gates' creative strengths," said Sam Albert, a 30-year IBM executive and now president of Sam Albert Associates, a Scarsdale, N.Y., market research and publishing firm.

Lotus juggles company structure

BY MAURA J. HARRINGTON

In an effort to focus its sales and marketing efforts more clearly, officials at Lotus Development Corp. announced last week that the firm has reorganized the company and entered the soft-ware consulting business.

The new company structure decentralizes operations into four independent business units: the Software Business Group, the International Business Group, the Information Services Group and the Consulting Services Group, according to the company.

The changes increase Frank King's already significant role in the company. King is now senior vice-president of the Software Business Group. Formerly the senior vice-president of the now-defunct Software Products Group for 1½ years, King's now has the responsibility for development of the North American Sales Division, to be headed by William Drummey, on top of his original work load. Drummey will report to King.

"I think King has quickly become an important part of this company . . . He's had a lot of impact on the organization," said analyst Chris Mortenson, who works in the New York office of Alex Brown & Sons, Inc., a market research company based in Raltimore

Lotus' newly formed Consulting Services Group will be headed by Frank Moss.

Moss, who was previously vice-president of the Networked Applications Systems Division, will now head the group that integrates Lotus and third-party software products for Lotus' clients, as the vice-president of the Consulting Services Group.

"Basically, we will start the consulting group off as a North American business, and over time we'll expand," said Robert Schechter, senior vice-president and chief financial officer, who will also take over responsibility for a unified customer support and services function under the reorganization.

Visa processing centers under construction

BY JIM NASH

Visa International last week announced the construction of a new transaction processing center for Asian/Pacific business and an expansion of its existing processing center in Virginia.

Construction has already begun on the center in Yokohama, Japan. It will become the fourth transaction processing center in the Visanet Delivery System, Visa's international network of computers that authorize pur-

chases as well as clear and settle accounts. The three existing sites are based in London, McLean, Va., and San Mateo, Calif.

Mike Massey, vice-president of Visanet operations, said the facility will be equipped with two IBM 4381s for processing transactions in 17 Asian and Pacific nations. The other three facilities run a combination of systems, including the more powerful IBM 3090.

When fully operational in the fourth quarter of 1990, the Yo-

kohama facility will handle the 200 million transactions that occur every year in the region.

At the same time, Visa is tripling the size of its information systems center in McLean. The firm said it expects to break ground on the 60,000 squarefoot annex in August. All IS equipment will be transferred to the annex beginning in October 1991

Neil Waldo, senior vice-president of Visanet, said the McLean plant is quickly reaching capacity.

Software with a foreign flair

Vendors show multilingual-function software at Cebit '90

HANNOVER, West Germany - Software packages featuring multilingual functions were among the products introduced last week in an attempt to capitalize on the international flavor of Cebit '90, the massive information systems and telecommunications conference.

The following, compiled from IDG News Service reports, is a summary of Cebit highlights.

Banyan Systems, Inc. is hoping to cross a variety of cultural divides with Version 4.0 of its Virtual Networking Software (Vines) network operating sys tem, which includes the capability to work in several languages.

Support for English, French (both Canadian and Parisian) and German are included in Vines Version 4.0, which began shipping in Europe this week. Spanish and Norwegian support will be added by the third quarter. Other languages will be added as the translation work, which is carried out by Banyan's distributors using tools provided by the company, pro-

Multilingual Vines presents all menus, Help screens and prompts to the user in his native language. Any system information in a message sent via Vines to another user is automatically translated into the recipient's language. The operating system can adjust to different time zones and daylight savings time.

Horst Nasko, chairman of the board of Nixdorf Computer AG, said the merged data and information technology activities of both companies into Siemens-Nixdorf Informationssysteme AG is expected to become operational as of Oct. 1.

The structural integration of the com-panies will not be decided until after West Germany's Federal Cartel Office approves Siemens AG's purchase of Nixdorf, Nasko said. According to Nasko, the approval is not expected before May 17.

Regarding layoffs, Nasko confirmed that 4,000 jobs in research and development, manufacturing and sales will be eliminated worldwide, dropping the number of employees from 28,000 to 24,000.

Microlytics, Inc., a manufacturer of linguistic and reference software products, introduced Multitrans, a multiple-lan-guage software program for IBM Personal Computers and compatibles that allows users to translate words and phrases between English, French and German. The system allows translation to and from any two languages available.

According to the firm, when a user requests translation for a particular word, a window opens to reveal a set of alternatives. Users can then choose the most appropriate word or phrase in its literal translation. Optional languages, such as Spanish, Italian and Dutch, can be added.

Available in two versions, Multitrans and Multitrans Professional, the program supports all major word processing programs. Multitrans features 20,000 words for translation and Multitrans Professional offers 40,000. Microlytics is currently seeking European distribution for Multitrans, which will begin shipping in May.

Faced with the political liberalization of

Eastern Europe and the significance of the European market as an alternative to the saturated U.S. market, U.S. firms have flocked to this year's technological labyrinth, which runs until March 28.

Headed by Apple Computer, Inc., IBM, Digital Equipment Corp. and Hewlett-Packard Co., the U.S. contingent included 312 exhibitors. Sprawling over more than 361,000 square meters of exhibition space, 36,000 more than in 1989, Cebit '90 drew 4,000 exhibitors, up from 3,214 last year, representing 41 countries; West German companies produced 2,470 exhibitors, followed by the U.S. and by Taiwan's 210 exhibits.

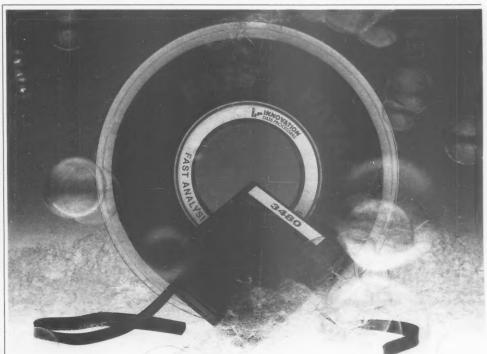

IXI Ltd. announced that it has further licensed its X.desktop Unix front-end user environment to IBM as part of the OSF/ Motif package for Personal System/2 systems. This follows a February announcement that IBM has also licensed X.desktop for all RISC System/6000 Powerstations and Powerservers.

IBM is offering AIX windows, the OSF/ Motif graphical user environment on the PS/2 running the latest version of AIX, Version 1.2, which was also announced this week. AIXwindows Desktop is a tailored version of Cambridge, UK-based IXI's X.desktop 2. As a result of the incorporation of X.desktop, AIXwindows of-

fers users an intuitive way of exploiting the PS/2 line.

Adobe Systems, Inc. announced Adobe Photoshop, a software package that allows Apple Macintosh users to produce both color and black-and-white images.

Adobe said Photoshop offers a complete palette of tools to edit and enhance images. Users can create original images and manipulate existing ones. The program works with images ranging from gray scale to indexed and true 24-bit color. Photoshop is "the first program to provide an integrated environment for creating and producing color images, said Aert Korteweg, marketing manager for application products at Adobe European headquarters in Amsterdam.

Maximize the Efficiency of Your Tape Librar

PAST ANALYSIS OF TAPE SURFACES (FATS) is a tape utility program which

permits online tape certification, verification and erasure.

- · FATS is designed to certify tapes where they will be used on the actual tape drives.
- FATS certifies scratch tapes and verifies that data files can be read FATS supports high-speed data security erasure of tape data.
- FATS provides a permanent record of each tape tested in the form of comprehensive detail and summary reports.

FAST ANALYSIS OF TAPE AND RECOVERY (FATAR) is a tape utility

program which analyzes and copies tapes, especially tapes with data checks or bad data.

For a FREE COPY of the **FATS and FATAR REPORTS** and a FREE 90 DAY TRIAL

CALL (201) 890-7300

FATAR is designed to:

- · Read tapes, including multi-volume and/or multi-file tapes.
- · Recover from I/O errors on tapes.
- · Copy tapes, including multi-file and/or multi-volume tapes in one execution.
- · Modify data on tape (while copying). Display and correct data check blocks on tape.
- · Validate and correct the record format of files on tape (including variable spanned records like SMF).
- Convert ASCII data to EBCDIC, EBCDIC to ASCII.
- Copy tapes to a different label type device type such as ANSI-to-IBM labels, or 6250 BPI to 3480 cartridge.
- · Re-block tape files while copying.

Available for VS1 and all MVS systems

FROM PAGE

International Data Corp. (IDC) in Framingham, Mass. For example, the new Model 80 386 A31 equipped with the maximum four SCSI boards can accommodate 28 devices, including hard disk drives that conform to the SCSI industry standard.

Users said they also see the benefits of an SCSI server. The ability to attach multiple devices to the server will be particularly important in large, departmentwide LANs, said Mike Horowitz, senior systems consultant at Allstate Insurance Co.'s corporate information resource planning department.

Micro Channel Architecture (MCA) enables users to take advantage of intelligent I/O devices such as SCSI, because users can perform data transfer directly to the system memory without taxing the CPU with MCA, according to an IBM spokesman.

IBM's decision to pack its new Model 80s with SCSI interfaces and more system memory "definitely makes it more attractive to us," said Horowitz, whose firm owns more than 1,000 PS//2s

IBM's chief personal computer rival, Compaq Computer Corp., does not offer SCSI in its Deskpro servers.

"SCSI gives you the capability to daisy-chain drives, but if you did that, it would degrade their performance," said Lorie Strong, Compaq's director of product marketing.

Although IBM did boost its lineup, Compaq is still superior, Strong contended. "Compaq introduced a 33-MHz 386 PC last May; IBM still hasn't got one,"

Compaq, considered a server market leader, sells a larger percentage of its PCs as servers than does IBM, according to IDC.

Still, IBM's server line needed this pick-me-up, analysts said. Despite an overall excellent year for the PS/2 family in 1989, "the one area where they lacked a competitive offering was the server area," Stephen said. The Model 80 server, introduced in 1987, was getting a bit long in

PS/2 ramp-up

the tooth, he noted.

Model 70 386

031 (Portable)

In fact, the Model 80 accounted for less than 7% of 1989 PS/2 unit sales through U.S. computer retail outlets, according to Storeboard, Inc. in Dallas.

Perhaps more significant, Model 80 sales in January 1990 were down more than 22% from January 1989 levels. IBM said it will not discontinue the older

The only PS/2 that sold worse

than the Model 80 last year was the Model 60. However,IBM's new Intel Corp. 803865X-based Model 65 SX should be able to shore up this sagging middle of the line. observers said.

"It's definitely of interest to us to have a lower cost workstation available to run OS/2 in the future." Horowitz said.

However, Horowitz and others are not envisioning the 65 SX as the entry-level file server IBM is touting it as.

\$5,995

"I'm surprised IBM did an SX server," Stephen said. "The SX is a hot-selling processor for desktop systems, but I don't think it's a hot seller as a server" because it is less powerful.

IBM also announced price cuts last week of 15% to 24% on Model 30s, 60s and existing 80s. The price cuts were not a surprise, said Jay Stevens, an analyst at Dean Witter Reynolds in New York.

"Every time we go through one of these announcements, the price point moves down," he said.

IBM keeps promise with OS/2 Extended update

BY CHARLES VON SIMSON

WHITE PLAINS, N.Y. — Rounding out the promised features of OS/2 three years after the operating system's introduction, IBM announced last week that Version 1.2 of OS/2 Extended Edition and LAN Server would ship by the end of this month.

Users and analysts said the latest version plays directly to the operating system's early adapters, while allowing for better accommodation of DOS.

"OS/2's pocket of strength has been in advanced networking," said Marshall Mosely, an OS/2 analyst at Dataquest, Inc. "It has been weak on the desktop, where its strength was expected. Extended Edition Version 1.2 will help on both counts."

Users seem to agree. OS/2 has found its strongest demand in advanced network environments, partially on the strength of earlier versions of Extended Edition, IBM's value-added addition to the operating system. It is the basis for Kentucky Fried Chicken Corp.'s leading-edge point-of-sale systems and also provides a basis for certain pieces of American Airlines' Sabre reservation system.

Extended Edition Version 1.2, which has been delayed by four months because of bugs and compatibility problems, is seen as an important extension of the capabilities that moved companies to OS/2.

"The early bugs in the system forced us to wait for a number of features, but the enhanced network functions seem to be fixed," said a systems developer at Fireman's Fund Insurance Co.

in San Rafael, Calif., a Version 1.2 beta-test site. "After a real false start, IBM has delivered most of what got us into OS/2."

In addition, Version 1.2 allows for greater coexistence with DOS. Systems managers in DOS environments said that the newest functions of Extended Edition make OS/2 a more comfortable alternative.

Extended Edition 1.2 fills in several missing pieces of the system with three modules. The Communications Manager includes new connections to IBM minicomputers and a 3270 gateway, as well as support for additional protocols including X.25, Systems Network Architecture (SNA) LU0 and SNA LAN Gateway. The Communications Manager also offers support for more than 1,000 simultaneous LAN

The Database Manager, which includes a complete Presentation Manager interface, has new remote data services features that will enable DOS and OS/2 workstations to access the same remote databases. The Database Manager also has improved query functions enabling users to download mainframe data and format it in tables along with data from local applications in a single step.

LAN Requester is a component of Extended Edition that enables the sharing of resources between OS/2 workstations. The \$1,040 price of Version 1.2 includes the DOS version of LAN Requester and entitles licensees to include up to 128 DOS clients. DOS LAN Requester was previously priced separately; its inclusion in Version 1.2 can save users as much as \$30,000 in license fees on a 100-node installation.

Peripheral vision

Besides the Personal System/2 boxes, IBM last week also began shipping another portable PS/2 Model 70 and several peripheral devices.

 The new P70 is a less powerful version of the existing portable, but at 20 pounds, it is no less weighty. The machine features a 30M-byte hard disk drive and 2M bytes of system memory. Based on Intel Corp.'s 80386 chip, the portable sells for \$5,995.

• IBM's first compact disc/read-only memory (CD-ROM) drive stores 600M bytes of ROM, the equivalent of 400 31/4-in. floppy disks. The internal version (for Models 60, 65 SX and 80) costs \$1,250. The external version for the rest of the PS/2 family costs \$1,550.

 As part of its small computer systems interface (SCSI) charge, the firm announced SCSI hard disk drives in capacities of 60M, 120M and 320M bytes. Prices are \$1,200, \$1,920 and \$5,500, respectively.

Also on the SCSI front come two Micro Channel SCSI adapters. The cacheless model costs \$495; a version with 512K-bytes of cache costs \$995.

An entry-level version of its existing 10 page/min laser printer, the new Laserprinter E, operates at 5 page/min but is upgradable to 10 page/min. The printer, which features Adobe Systems, Inc. Postscript options, is priced at \$1,495.

• IBM's newest PS/2 color display, the 8515, features a 14-in. screen with 1,024- by 768-pixel resolution. It sells for \$950.

Adapso urges dropping Singapore subsidy suit

BY DAVID A. LUDLUM

Adapso, the 'eading trade association for U.S. software makers, has urged the U.S. Department of Commerce to drop an investigation into charges that the government of Singapore unfairly subsidized a software product.

Members of Adapso are worried that a decision to slap import duties on software from Singapore could lead to a trade war that would hurt U.S. software makers, said Douglas C. Jerger, a spokesman for the association. that the alleged subsidies have not harmed U.S. software companies, including the one that charged Singapore with unfair trade, Visible Systems Corp. of Waltham, Mass. That company has not contended that it has been harmed by the alleged subsidies.

Last August, Visible Systems charged that Singapore subsidized Pose, a computer-aided software engineering tool marketed in the U.S. by CSA, Inc. of Woodcliff Lake, N.J.

The Commerce Department was scheduled to make a final ruling in the case today. In Janu-

ary, it reached a preliminary decision finding that Singapore unfairly subsidized Pose and calling for countervailing duties on imports of the product.

Adapso asked the Commerce Department to use "moderation" in imposing import duties. It suggested the department base duties on clear evidence of subsidies

One concern of U.S. software makers is that foreign governments could rule that the U.S. government provides subsidies through its arrangements for procuring software, Jerger said.

The preliminary ruling in the case was the first in which the Commerce Department found a software product had been subsidized. The ruling also broke new legal ground by establishing that software on disk or tape can be subject to U.S. import duties.

Adapso officials also believe

Opening Database Servers To The Whole World.

ORACLE Server. Nonstop data sharing among PCs, Macs, minis, and mainframes.

Imagine the frustration of being in an airplane that can only take off and land at the same airport. Ashton-Tate's SQL Server suffers that same problem. It limits users to a single server running just OS/2 and Named Pipes.

ORACLE® Server is different. As an open server, it works with virtually any network, any operating system, application or database system.

So ORACLE can act as an information hub to share data across an organization's PCs, Macs

minis and mainframes.

ORACLE Server works with existing Novell, 3Com, and IBM LANs as well as Lotus 1-2-3 and Dbase applications.

It even allows access to corporate data stored in other vendors' software such as RMS on DEC minis and DB2 on IBM mainframes.

And only Oracle provides a set of integrated tools for portable application

office automation and CASE. It also has interfaces to the most popular programming

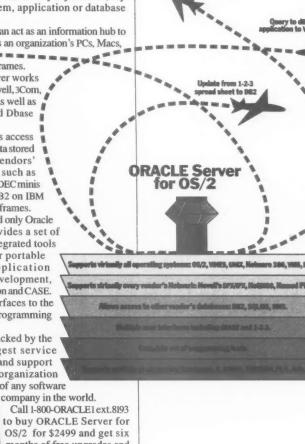

and support organization of any software

> Call 1-800-ORACLE1 ext.8193 to buy ORACLE Server for OS/2 for \$2499 and get six months of free upgrades and phone support.

Or you can try the 3-user Developers Version for \$699.

IBM influence spreads to East German IS boundaries

IDG NEWS SERVICE

STUTTGART, West Germany - IBM Deutschland GmbH is quietly extending its influence to large computing centers in East Germany.

IBM's West German subsidiary, based in Stuttgart, recently began cooperative efforts with seven computing centers belonging to the Data Processing cooperative. With some 13,000 employees, the cooperative is the second largest supplier of information systems services in East

According to IBM Deutschland, it will work with GDR Data Processing Centers (DPC) and the continuing education academy of the Data Processing cooperative in training and continuing education, software development and the sale of selected IBM products as well as maintenance and consulting in East Germany. The products involved will be mainly IBM Personal System/2s, 9370s and Application System/400s.

According to Johann Weihen, head of IBM's commercial relations with East Germany, business activities can be started immediately. Activities will be based on the same dealer concept that IBM Deutschland currently follows in West

Boot camp

The DPCs, which were previously classified as legally independent enterprises, are now undergoing training programs in maintenance, sales and marketing to become IBM dealers

Weihen also said the Data Processing cooperative was chosen because, among other attributes, its "computing centers

provide employees (who are) highly qualified in software development and customer service. The strongest dealers are the ones who not only move the most units but who can also offer the entire service package as well."

In addition to providing computing time, the DPC also has substantial experience with software production. "It is usually the case that these houses conceive, design, program, test and install their applications for the customer," Weihen explained.

He said he expects that other qualifying East German businesses will be awarded IBM dealer status. "Concentration on the DPCs alone is not enough," he

Clear advantage
On the average, the DPCs employ between 600 and 800 people, Weihen said. Taking into account a couple of exceptions that already have IBM 4341 computers, all of the computing centers use Unified Electronic Computing System Technology computers.

These IBM 370-compatible computers, which are present throughout the Eastern Bloc, will provide market opportunities for IBM and offer an advantage over the competition.

Alfred E. Esslinger, president of IBM Deutschland GmbH, said he sees the agreement from another perspective: "For both sides involved, this is an important step toward the introduction of information technology support for businesses in East Germany.

In conjunction with the recent technology fair in Leipzig, Hans-Olaf Henkel, chairman of the board at IBM Deutsch-land, called for the "tearing down of the Cocom wall" or the immediate removal of East Germany from the Coordinating Committee on Multilateral Export Controls' (Cocom) sphere.

Henkel said he regards as outdated the Cocom treaties that make exporting strategic high-tech materials to the Eastern Bloc more difficult.

This report was prepared by the staff of Computerwoche, an IDG Communications West German publication.

IBM, Robotron sign agreement

PARIS - IBM Deutschland GmbH, the West German subsidiary of IBM, recently signed a cooperative agreement with East German electronics group VEB Robotron to service and maintain Robotron's medium-size computers in Eastern Europe.

According to IBM, the company will cooperate with the Robotron unit that manufactures auditing machines in Karl-Marx Stadt and Robotron's sales unit in

Further talks between IBM and Robotron will focus on the possibility of a joint venture. Such a venture would involve Robotron's activities in information sys-

IBM said that the partners will cooperate in the sales and service of IBM computer products in East Germany and in software development. It added that Robotron's medium-size computers were based on IBM computer architecture. This is the first agreement between IBM and Robotron.

Buying a mainframe printer wouldn't be so costly if you could print this with it.

Avatar printer emulation products can save you up to 50% on printing costs as compared to mainframe printers. How? Instead of paying six to ten thousand dollars for a mainframe printer, you can quickly, easily and quite inexpensively connect any PC printer to vour 3270 system mainframe

IBM[®] has a great idea.

They're talking about getting their SAA databases to talk to each other.

But all they have been able to do so far is to get one MVS machine running DB2 to talk to another MVS machine running DB2.

ORACLE® Version 6 turns all the talk into action.

ORACLE is both open and distributed. So organizations can integrate different computers, operating systems, networks — even different database management systems — into a cooperative computing and information sharing environment. This preserves investments in existing hardware

and software, and gives users the freedom to introduce new technology from any vendor.

Because ORACLE is a distributed DBMS, it provides transparent data sharing between IBM computers running MVS, VM and OS/2™ ORACLE also runs on VAX™VMS,

UNIX, MACs, etc., so your IBM computers can share data with non-IBM machines as well.

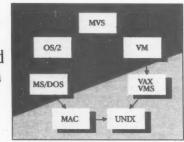

ORACLE is also an open DBMS, with gateways to data stored in other vendors' database management and file systems, such as IBM's DB2 and IMS, and DEC's RMS™

Now users can access data stored in different databases on different computers with the same ease as if all the data were stored in a single database on a single computer.

ORACLE is backed by the largest support organization in the software industry. Nearly half of our 8,000 employees are specialists, experienced in applying a particular technology, such as

> networking or database design, to a specific industry, such as insurance or aerospace.

If you want to get your IBMs talking to each other, and everyone else, talk to us. Call 1-800-ORACLE1, ext. 8181 for the Oracle Sales Office near you.

Lotus upgrades Magellan, tunes up Symphony

BY SALLY CUSACK

CAMBRIDGE, Mass. - Harried personal computer users may have something to cheer about as Lotus Development Corp. last week unveiled Version 2.0 of Lotus Magellan, its utility

software for IBM and Compaq Computer Corp. PCs and compa-

Originally released last April, the program was designed to assist DOS-based PC users in finding, viewing and utilizing data stored on hard disks. The latest version reportedly includes additional tools that allow users to quickly locate data, compress files, recover deleted files and check for possible file corruption because of viruses.

The package is user-customizable and costs \$139. Current Magellan users can obtain an upgrade for \$39.

In a separate announcement last week, Lotus began shipments of Symphony 2.2, the latest version of its multifunction, integrated PC software package.

I don't see the latest release [of Symphony] dramatically increasing market share for highend integrated packages," said

Bill Higgs, vice-president at Santa Clara, Calif.-based Infocorp/ Gartner Group, a market research firm.

Version 2.2 includes file linking between Symphony and Lotus 1-2-3 Release 2.01 and 2.2 files and incorporates the Lotus Magellan viewer utility pro-gram. The package also offers Personics Corp.'s @Base program and a more functional integration of Allways publishing technology, according to Lotus.

With a suggested list price of \$150, some Symphony users may think twice before purchasing the upgrade. Beta tester Hilly Fuchs, director of information systems development at Continental Grain Co. in New York, said his company will only upgrade part of its installed user base. Continental Grain has approximately 3,000 PC users, about 1,200 of whom run Sym-

Symphony 2.2 requires a hard disk, one floppy disk drive and 512K bytes of memory; there is a 640K-byte memory requirement for Allways or @Base add-in programs.

HDS boosts mainframes

BY J. A. SAVAGE

Focusing its new marketing organization on IBM 4381 and lowend 3090 mainframe users. Hitachi Data Systems introduced two new models of its own mainframes last week

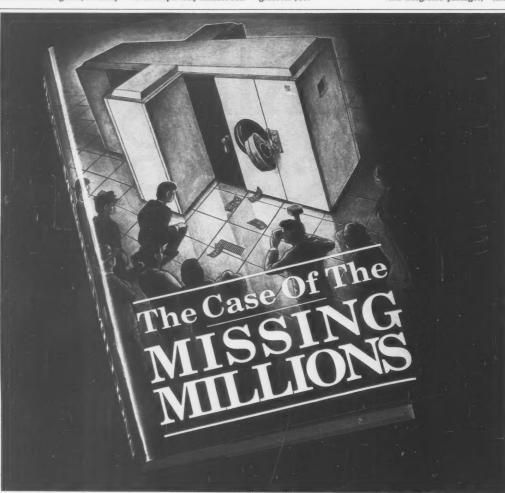

HDS' Paul Hastings, vicepresident of product marketing for intermediate systems, said his company is trying to provide a growth path for 4381 users while they wait on a 4391 announcement from IBM. Currently, if a 4381 user wants to stay in IBM's fold, the option is a 3090 mainframe, which requires water cooling and more floor space.

HDS has put new resources into marketing since it was bought by Hitachi Ltd. and Electronic Data Systems Corp. one year ago; this is the first public view of that change.

While the company may be repositioning, the models have changed little, according to Bob Djurdjevic, president of Annex Research, a Phoenix-based consulting firm.

Sandwiched between its AS/ EX Models 30 and 35 is the Model 33 uniprocessor with a list price of \$1.38 million. According to the company, it almost equals the performance of an IBM 3090-150J, or up to 10 million

instructions per second. A dual-processor computer, the AS/EX 44, now tops the previous AS/EX 44 model by about 25 MIPS, HDS said. It is priced at \$2,63 million.

YOUR 3090 STORAGE BUDGET MAY BE GONE BEFORE YOU KNOW WHAT HIT YOU.

Millions of dollars are disappearing from the budgets of 3090 users right be-

fore their eyes. Because the storage most 3090 users are buying to get the advantages of features like Hiperspace and Hiperbatch is hyperpriced. That's why two of the world's leading indepenent storage companies, EMC and Storage Tech-

nology, are teaming up-to bring the cost of 3090 ownership down.

rage Technol

The Small Change is Worth Millions.

A change in storage vendors can literally save you millions of dollars.

Because whether your current storage needs are great or small, the need itself grows exponentially. In fact, over time the cost of the central and expanded storage in your 3090 may account for over half your total system cost.

The System **Enhancement Company.**

Maintaining IBM's DB2 data base management system at peak performance is not an easy task. As your system grows, sustaining maximum functionality and efficiency will become more and more difficult. However, with the right kind of help, the job becomes infinitely easier. DB2 Masterplan™, BMC Software's complete line of high performance DB2 products, contains the power tools to help you administer your DB2 system at its highest level, even as the environment becomes more demanding.

DB2 Masterplan products are built tough, to withstand the rigors of a fully functioning DB2 system, and their versatility promises smooth, easy-to-use operations in your initial start-up of DB2 and under the most trying conditions. As your company's level of sophistication in the use of DB2 grows, you'll find that DB2 Masterplan is increasingly valuable to you. The more you demand, the more these power tools deliver.

With BMC's new Easy Install System (EIS), you can install DB2 Masterplan products in about an hour. In addition, because of the extensive online documentation for EIS, there is no need to refer to manuals during an installation.

DB2 Masterplan includes the following products:

■ DB2 MASTERMIND™

DB2 CATALOG MANAGER—For performing DB2 administrative functions. It's interactive, intuitive and easy-to-use.

DB2 ALTER™—Complete support for changing, copying and migrating DB2 data structures.

DB2 DASD MANAGER—Manages DB2 physical data sets.

- DB2 REORG PLUS—Reorganizes DB2 data bases twice as fast.
- DB2 COPY PLUS—Significantly reduces time and cost to make image copies.
- DB2 ACTIVITY MONITOR—Online information to control DB2 performance.
- DATA PACKER™/DB2—Reduces DASD requirements and improves performance.

Legal eagles train eyes on \$48M verdict

BY CHARLES VON SIMSON and JIM NASH

LOS ANGELES — When the jury hands down the final verdict on damages in a \$48 million computer liability case in U.S. District Court next month, its deci-

sion is likely to change the legal aspects of the relationship between computer systems vendors and their customers.

On April 17, the trial will begin to award final damages in the case of plaintiff Geophysical Systems Corp. (GSC), an oil and gas exploration company in Pasa-

dena, Calif., vs. Seismograph Service Corp. (SSC), a Tulsa, Okla., software and service subsidiary of Raytheon Co. If the full \$48 million award from the case's initial trial stands, it will represent by far the largest computer liability decision to date.

Such an award could push us-

ers and vendors to take contract language more seriously. According to lawyers who have worked on computer liability cases, contracts are often seen as formalities and are too casually worded. Typically, too little emphasis is placed on narrowly defining the expectations of both vendors and suppliers, they said, which will have to change as technology becomes more criti-

cal to business and as damage awards increase.

"The size of the award demonstrates the critical nature of technology in business," said Lee Hagelshaw, a partner in the San Francisco law firm of Hagelshaw and Cole and editor of the "Computer Liability Report" newsletter. "It will mean that the signature on a systems contract will have to mean something; it will not just be a formality to get the project rolling."

At the conclusion of the first trial in December 1988, a jury awarded GSC \$48.3 million plus costs for damages incurred when seismic data processing software from SSC failed to work as promised on GSC's Digital Equipment Corp. VAX computers. GSC claimed that none of several software runtime performance requirements were met and that data interpretation applications did not work as promised.

GSC claimed that SSC's inability to process the data to be used in the seismic mapping of underground oil deposits destroyed its business, a contention that the jury supported. The bulk of the damage award is based on GSC's claim that the failure of the system and subsequent lost contracts forced it to file for Chapter 11 bankruptcy protection in 1983.

While upholding the breachof-contract verdict, Judge A. Wallace Tashima set aside the damage award because he said he felt the jury did not fully understand the implications of his decision to throw out the plaintiff's fraud claim. This set the stage for next month's retrial.

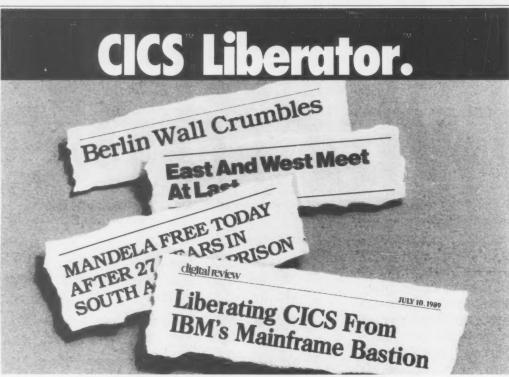

Back on its feet

GSC, still operating under Chapter 11, is hoping the award will help it get back on its feet. "When you commit to a computer company, that is a major commitment," said William Walter, GSC's chief engineer. "When their systems started to fail, we had built the business around them. We were in big trouble."

The defense has argued that systems did not fail and that, in the cases in which the jury found they did fail, they did not substantially contribute to the failure of GSC's business.

"To the extent that we have been found to have breached [the contract], those breaches did not cause them any significant damage," said Steve Holtman, a partner in the Cedar Rapids, Iowa, law firm of Simmons, Perrine, Albright and Ellwood, the attorneys for the defendant. "It certainly did not contribute to the downfall of the company."

While several multimillion-dollar liability awards have been made in the past for systems that failed to function as promised, none comes close to the size of the GSC verdict. The few that are not settled out of court typically result in awards in the \$3 million to \$5 million range.

A BANNER YEAR FOR FREEDOM LOVERS EVERYWHERE.

Freedom. A great idea whose time has come.

Now ASCI defines a new freedom. Freedom to choose VAX transaction processing... sometimes. Freedom to choose Digital's desktop-to-mainframe solutions for operational flexibility and hardware savings. Freedom to develop and maintain IBM applications under DECtp.

Freedom of choice, with CICS Liberator.

CICS Liberator integrates transaction processing by allowing CICS application development on the VAX, for eventual use on either system. The result: improved productivity and time-to-market.

Of course, if you're ready to migrate to the VAX, Liberator will do that with minimal programmer intervention. ASCI's Liberator Consulting Services can provide migration assistance at any level in getting your applications ready for the VAX.

Now that's freedom of chaice.

CICS Liberator. It may not be the biggest news in freedom this year. But for IBM Managers everywhere, it's a brookthrough close to home.

Ready to be Liberated? Try our FREE Qualification Service.

Send us several typical CICS and non-CICS programs complete with copy books, CICS resource definition tables, and BMS/SDF map definitions. Or call to arrange the desired so fyour FREE Qualification. We'll migrate your programs and send a full report on the trip.

Limited Time Offer.

Call ASCI today: 201-798-6400 Fax: 201-798-9203

The SAS System is now at work in 88 countries.

Why the World of Business Relies on the SAS System.

When millions of records and billions in revenue all ride on your data, you can't settle for anything less than the world's most reliable software. That's why more than 75% of the world's most successful companies — from finance to pharmaceuticals, manufacturing to mining — depend on the SAS System. The #1 applications software system.

A World of Choices

We've designed the SAS System for practically any application that involves accessing, managing, analyzing, and presenting data — from shop-floor quality control to top-floor executive information systems. And because SAS applications run the same regardless of hardware, you have the power to decide where those

applications belong — in the data center, at the department level, or on the desktop.

World-Class Service

The SAS System is backed by expert technical support and consulting services, continuous enhancements, and comprehensive documentation and training. All from SAS Institute Inc., one of the world's most respected names in software.

See for yourself why thousands of companies turn to the SAS System for their most strategic applications. Call us now at (919) 677-8200 and ask for your free Executive Summary and details about our free 30-day software evaluation. In Canada, call (416) 443-9811.

The SAS® System.
More Choices
for More Applications
than Any Other Software.

For a school district, every dollar spent on networking means one dollar less for classrooms. And playgrounds. A school district is just like a business: every dollar counts. That's why more and more school districts—

and businesses—are discovering the real world advantages of creating a Wide Area Network (WAN) through their local phone

You and Your Local Phone Company

company. Working with AT&T Network Systems, your local phone company can show you how the AT&T Datakit® Virtual Circuit Switch could network all your computers. Efficiently. Quickly. On existing twisted pair phone lines. The results for school districts? Potentially thousands of dollars in savings. And if a WAN can do that for a school district, think of what it could do for your company. Get smart. Call your local phone company marketing representative.

Floating Point Systems seen cutting back on sales force

BY J. A. SAVAGE

BEAVERTON, Ore. — Posting still another losing quarter, Floating Point Systems, Inc. (FPS) appears to be cutting back on its sales force in order to trim expenses.

Since the beginning of the year, FPS has fired between five and 10 salespeople, mostly on the East Coast. Former employees who wished to remain anonymous

said this leaves as few as 15 U.S. sales representatives for the company.

Stephen Campbell, vice-president of marketing, maintained that 50 salespeople remain, although he conceded that offices have been "consolidated."

Theresa Liu, an analyst at Montgomery Securities in San Francisco, said she would not be surprised by the lower number. "I've heard they are prepared to be a service company. It looks dismal," Liu said.

The company cut about 250 jobs in 1989. At its annual meeting, held earlier this month, Chief Executive Officer Howard Thrailkill said the company was down by a total of another 20 employees, leaving more than 400, according to Campbell.

FPS has reported losses for the last three years, totaling about \$74.4 million, on steadily decreasing revenue. The company, a pioneer in minisupercomputers, recently began concentrating on production of a stand-alone Unix-based computer, the Model 500, rather than its original line of front-end systems for Digital Equipment Corp. VAXs.

In 1988, it abandoned research and development efforts on a massively parallel supercomputer and was unable to find any

companies willing to buy out its technol-

According to ex-employees, FPS has sold about 40 Model 500s, but all sales have been at deep discounts, primarily to universities and nonproduction sites. Campbell would only say that there "were more than 35" installations and said the average system price has been about \$500.000.

The system's list price ranges from \$395,000 to \$1.75 million.

Software group charges major firms with piracy

BY RANDAL JACKSON SPECIAL TO CW

AUCKLAND, New Zealand — A major New Zealand bank, an oil company and an entertainment group are among the companies identified by the Business Software Association (BSA) as allegedly pirating software here.

When it has finalized its case, the association said it will attempt to prosecute one of the most prominent offenders un-

der the copyright laws.

Association spokesman Don Sykes of Imagineering Software estimated that his company alone would double its revenue if pirating and gray market sales were eliminated. Imagineering has the Lotus Development Corp. distribution license for New Zealand, and Sykes said requests for service and product updates indicate it has probably supplied only 20% of all Lotus oftware that is now used in the country.

Sykes would not publicly identify the alleged offenders. "But we'll definitely be prosecuting one of them," he said.

Another BSA committee member, Peter Macaulay of Number One Software Co., said many companies have begun straightening out their affairs, and some have requested audits. He said senior management was often unaware of pirating because it usually happened at the middle-management level to cut expenses.

Learning-based

In the longer term, education is the main area the association will target to try to reduce the problem.

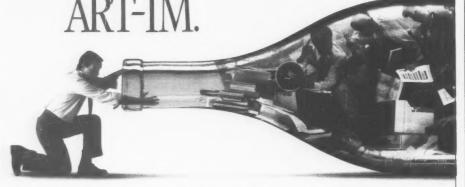

The U.S.-based BSA was formed in 1988 as a collective of key software companies concentrating on software protection, piracy and market-access issues.

The visiting chairman of the association, David Curtis, who is a Microsoft Corp. senior attorney, and Lotus international counsel Neal Goldman met local industry representatives from Microsoft, Ashton-Tate Corp., Imagineering, Number One Software and Itanz last September to talk through the problems. A local branch of the BSA was later established by the firms.

At that time, Curtis said the group's focus would be end-user piracy, mainly in the commercial and education markets, to ensure that users understood the copyright laws and could reevaluate their software acquisition policies.

Jackson is a reporter at Computerworld New Zealand.

Relieve your CICS and IMS application backlog with

If you're like most CICS or IMS shops, you're probably spending 80% of your time and expenses on maintaining existing programs. Which makes it virtually impossible to meet increasing user demands. As a result, you've got an enormous application backlog. Now, Inference can help you address it with ART-IM.™ the Automated Reasoning Tool for Information Management.™

ART-IM is a powerful tool for developing applications in MVS, CICS, IMS, MS-DOS and OS/2. Its impressive rulebased and object-oriented programming offer vast advances over procedural programs in solving everyday problems.

Dramatically reduce your maintenance expense.

Frequent changes in business policies and procedures can turn your software applications (e.g., payroll) into spaghetti code. Modifications become difficult and testing becomes time-consuming. Your applications cannot keep pace with your business.

With ART-IM, however, your business policies can be directly represented as software business rules — each independent of the other. For instance, you can represent one business rule with one ART-IM rule.

Unlike procedural programs, rules can be added, deleted and modified—independently of any other rules in the application. A change in policy maps directly to a change in the software statement that represents it.

Extend user functionality.

By capturing the knowledge and experience of your best decision makers, your ART-IM application becomes a reservoir for the company's expertise and its evolving policies and procedures. You can then make this invaluable information available on-line to your entire organization.

What's been the impact on end users? A new level of functionality never before available for making consistent and accurate decisions.

A long track record of successful customers.

Ten years of technology refinement has made Inference a leader in the industry. We've helped many companies successfully implement production expert system solutions. Our practical building block approach allows us to offer an extensive range of knowledge-based products and professional services, depending on your needs and resources.

Today, our customers are using ART-IM to cut maintenance efforts dramatically. In addition, many are reporting ten-fold improvements in development productivity.

So if your applications backlog has created an enormous bottleneck in your productivity, ART-IM can help you find your way out. For complete information, call Chris Dow at (213) 417-7997.

Or write Inference Corp., 5300 W. Century Blvd.,
Los Angeles, CA 90045.

Don't Let Personal Feelings Get In Your Way.

Old habits are hard to break.

But you don't have to give up the personal computer you know, to get the networked computer you need.

Introducing a computer that gives you the freedom of both. The MultiPersonal™ Computer from Motorola.

Yes, it runs thousands of DOS applications. And supports your existing PC networks. Plus a whole lot more.

It gives you the power of UNIX*
and full X compliance—which
puts hundreds of
UNIX applications
within reach—

Ext. 165
1-800-4

even for PC users. And it provides multiples of everything: Multiple hosts. Multiple applications. Multiple databases. And multiple tasks. Concurrently. It makes seamless network computing as easy as point and click.

Best of all, it comes with the Motorola commitment to uncompromising quality and open computing standards.

So set your personal feelings aside. Call 1-800-556-1234, Ext. 165. In California, 1-800-441-2345, Ext. 165.

And make way for the MultiPersonal Computer.

Network Computing With A Personal Touch

ADVANCED TECHNOLOGY

For the disabled, home is where the future is

State-owned showcase of customized devices for the handicapped promises hope of an independent tomorrow

BY MARYFRAN JOHNSON

19th-century Baltimore toll house that once played host to the horse-and-buggy set is becoming a high-tech living laboratory of home automation for people with disabilities.

Although the outside of Smith's Tavern on Jarrettsville Pike has been restored to its classic 1855 appearance, the now-gutted interior

of the historical landmark will reflect the next century rather than the past.

When it finally opens to the public next year, the Toll House Future Home will be a fully automated, computer-driven "intelligent" house loaded with motion detectors, infrared sensors, video cameras and speakers.

"The house will be able to touch, feel and see what's going on around it," said Wilson Rivera, a Westinghouse Co. engineer who manages the project for the Volunteers for Medical Engineering (VME), a nonprofit Baltimore-based organization that adapts technology to assist disabled people.

The state-owned building will be a showcase of products, systems and customized de-

vices that will enable the handicapped to live independently. A personal computer will control all systems in the house through customized software programs.

Curators in residence

Future Home will also be the home of David and Terri Ward, the state-appointed resident curators who have spent \$100,000 of their own funds to renovate the exterior. The interior gadgetry will be supplied by VME members, using low-cost, off-the-shelf electronics married to computer software.

"One of the real problems in selling home automation, and even computers, is there are still numerous people in this country who are intimidated by technology," said David Ward, who is wheelchair-bound after being paralyzed from the neck down in a fall 13 years ago.

In addition to living in what he cheerfully calls "a testbed of technology," Ward will act as master of ceremonies for tours of handicapped people. "We want to set up the environment for them so they get more control over it without having to do anything," he added. "They don't even have to know they're using it."

For people who cannot push a button or flip a switch, a voice command may be used to activate security cameras, turn up the stereo volume or drop the room temperature by a few degrees. The click of an infrared remote controller — similar to the ones used to change TV channels — could turn on the oven, start the coffee maker or fire up the hot tub.

Even the blink of an eye could activate a preprogrammed series of events or "scripts." A "going to bed" script, for example, might turn down the heat, arm the external security cameras and dim the lights.

ious disabled communities. An audio system might need to become a system controlled by visual blinking or touch screen tomorrow."

Behind it all will be "computer brainpower" in the shape of an IBM Personal Computer or compatible clone or an Apple Computer, Inc. Macintosh, depending on which machine is donated to VME.

The house is now being wired with fiber-optic, coaxial and twisted-pair telephone cable to carry signal traffic chapters nationwide.

The donated home management devices being used are Home Manager, a touch-screen environmental control device from Unity Systems in Redwood, Calif., and Butler-in-a-Box, a voice-recognition device from Mastervoice, Inc. Since Home Manager and Butler-in-a-Box were not intended to function in tandem, the engineers are joining the dedicated processors in the two home management devices with a PC software interface.

Also integral to the functioning of Future Home is a prototype audible recognition intelligent computer, a voicerecognition, voice-synthesis computer designed by another Westinghouse engineer, Herb

Standards struggle

One complication in creating this "intelligent" house is the ongoing industry battle over which electronics wiring technology will become the home automation standard.

In one corner is Smart House; in the other, the Consumer Electronics (CE) Bus. Both are universal communications protocols that allow consumer electronics, heating and cooling systems, PCs, appliances, security systems and telephones to communicate

with one another.

With its first products due in April 1991, Smart House will initially work only for new construction because of the wiring, gas and plumbing systems required. The system has been under development for five years by the Maryland-based Smart House Limited Partnership, a private, wholly owned subsidiary of the National Association of Home Builders.

CE Bus is being developed by the Electronics Industry Association, a nonprofit trade group in Washington, D.C. Eventually, the group will set separate standards for manufacturers of home automation devices covering power line access, command language, coaxial and twisted-pair cable and a "single room" bus that controls infrared and radio signals.

Future Home is being wired only for CE Bus, Ward explained, because acquiring the Smart House technology would have cost the VME at least \$15,000 to wire the house.

"What's holding us up now is, as much as anything, financial. All of our electronics, everything, are being donated by somebody," said Richard Goldman, technical director for Future Home and president of Intellitech, Inc. in Owings Mills, Md.

Eventually, the group hopes to support Future Home through the sale of the home management software or other devices created there.

John S. Dykes

"A lot of technology that able-bodied people use can almost be applied as is for the disabled community," Rivera said. "But David can't use a touch screen because he can't raise his hands. So we have to solve a different human interface problem for

By taking existing technologies in "bits and pieces," the VME is designing a system flexible enough to switch-hit from one disability to another, Rivera explained: "We want to make it adaptable to the needs of var-

to and from various appliances and devices. From a lab on the second floor, separated from the Wards' living quarters, the VME engineers will control the home management systems and experiment with newer gadgets as they hit the market.

"We're leaving ourselves open to infuse all sorts of technology later," said John Staehlin, a Westinghouse consulting engineer who founded VME in 1981. Baltimore VME members will share what they learn in running Future Home with 12 VME

Welcoming folks of all trades

he first mistake people make about the Volunteers for Medical Engineering (VME) is thinking that the nonprofit group is comprised only of engineers.

Actually, the organization welcomes the expertise of secretaries, artists, technicians, accountants, mathematicians, lawyers and anyone else whose skills might assist the disabled.

With chapters in 12 states, VME has helped about 500 handicapped or elderly individuals by adapting technology to their needs, said VME President John Staehlin, a Westinghouse Co. consulting engineer who founded the group in 1981.

Two of VME's inventions, available through the organization, are the VME Mobile Standing Frame and the VME Blink Writer.

The standing frame functions as a standing wheel chair for paraplegics, while the blink writer attaches to eye glass frames and allows the user to control computer cursor movement through eye blinks.

The VME can be reached through The Good Samaritan Hospital in Baltimore at 301-532-4360.

There are a couple of reasons to buy the new HP LaserJet III printer.

One for the money.

Our third generation HP LaserJet printer is here. And with it comes a better class of print quality. And lots of dramatic new features that establish, once again, that HP LaserJet printers are in a class of their own.

But the most remarkable breakthrough of all may be the price. Listed at \$2,395,* the HP LaserJet III printer is a good deal less than the HP LaserJet Series II printer it replaces.

The clearer, richer output is created with the help of HP's new Resolution

Enhancement technology. This changes the size of the dots so they fit where other printers' dots can't. So say goodbye to the jaggies. And hello to curves that really curve.

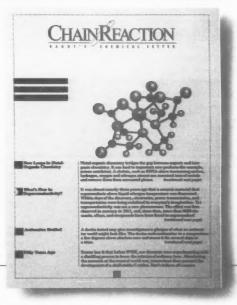

You'll see the difference in every document, thanks to our enhanced PCL5 printer language, including HP-GL/2 graphics language. 14 bitmapped and 8 internal scalable typefaces provide thousands of options. Portrait and landscape on the same page. Regular or reverse

Two for the show.

type. Shaded text. Mirror images and spirals.

And you don't have to stop there. You can plug in authentic Adobe PostScript* software. Add memory and our Master Type Library of fonts and typefaces. Even connect with your Macintosh. All while enjoying the same HP reliability and service. The same hardware and software

compatibility, such as WordPerfect 5.1 and WordStar® 6.0. The same 8 ppm speed. And the convenience of having a whole HP LaserJet family to fit the task at hand. The HP LaserJet IIP printer for personal, desktop printing. And the HP LaserJet IID printer for heavier volumes of paper-handling.

So call 1-800-752-0900, Ext. 1008. Ask for our booklet on Resolution Enhancement technology. And enjoy an even better show for an even better price.

There is a better way.

EDITORIAL

On the fence

T'S A STORY we've heard again and again:
An alluring technology stalls because the user base stops short of critical mass. Electronic data interchange's two-year surge may be slowing because technical and cost issues

can't be resolved quickly enough.

In theory, EDI's electronic umbilical cord between buyers and sellers offers tantalizing opportunities for productivity gains. Imagine if a department store's order for 5,000 blouses could be fed electronically into the manufacturer's flexible controllers on the ship floor, where stitching machines retool to make just the right mix of garments. Then the data is passed to the shipping department, which schedules it on the first available truck, and to accounts receivable, which bills the buyer electronically. Meanwhile, the computer is collecting data about the buyer's ordering habits.

The technology exists to do this right now, but EDI is running into some walls that are just going to take time to tear down. First, there's that old standards bugaboo: Different industries use different EDI formats, and an international standard is still a long way off. Users who have taken the EDI plunge say multiple standards aren't so bad after all, but EDI newcomers are put off by all the haggling and obscure acronyms.

They're sitting on the fence.

Fence-sitting is a problem in itself. EDI, by its very nature, offers bigger benefits with more frequent use. Companies that go fully to EDI for all dealings with their suppliers can begin to rethink the whole supplier/customer relationship. Not only can they cut paperwork, but they can also use EDI input to trigger multiple events in the office and in the factory at the same time. Virtually nobody is 100% EDI-capable now, and the few companies bold enough to force the issue have taken heat from their suppliers. Small suppliers often don't want to pay the up-front investment in time, hardware and business restructuring that EDI requires, but forcing the issue is the only way to get them on the bandwagon.

Then there are the legal issues. EDI's limited use to this point has kept it from being the subject of a major lawsuit, but experts say it's only a matter of time. What will happen when a customer sues a supplier, claiming it never ordered those 5,000 blouses, and the supplier can't provide a paper trail to back itself up? Who is responsible for a message that is sent but never received? There's no way to tell how such cases would be resolved. In the meantime, stopgap contract language will do little to make potential

users feel more comfortable.

It would be unfortunate to see these concerns hobble an otherwise promising movement. EDI has the potential to improve productivity sharply in some of the most paper-intensive and errorprone functions of business. By offering incentives to small suppliers to take the plunge, big buyers can help the process along. The EDI industry can also contribute by resolving to explain the concepts in terms that the small-business owner can understand.

LETTERS TO THE EDITOR

No magic

I do not agree that Robert T. Morris is a computer wizard, as you would have me believe [CW, Jan. 29]. A computer wizard, in my opinion, is someone who can identify and solve complex computational problems using conceptional, theoretical and practical techniques that most programmers would not possess.

Ideally, a computer wizard would have a rather high intellectual quotient, work well with other programmer/analysts, develop advanced and sophisticated computer systems and have sufficient self-esteem and integrity to be considered a role mod-

el for others.

However, it would appear that Morris is only an individual who has shown where a lack of sufficient controls can result in unauthorized access, destruction of sensitive or critical data and unnecessary loss of computing capabilities while the virus is located and eradicated. Morris should not be treated as someone with superior intelligence and cunning but rather as someone who was caught committing a criminal offense and who will spend time in jail as a result. If there ever was a computer wizard, in my opinion it would have to be the person who invented pull-down windows

Jon L. Campbell EDP Auditor Honda North America, Inc. Torrance, Calif.

Old news

I take exception with the cartoon about the non-IBM customer [CW, Feb. 5]. For those who have less than a Hewlett-Packard Co. HP 3000, I can understand their feelings. But for those of us who have had the privilege and joy of working on an HP 3000, this is a joke.

The HP 3000 series of computers has been doing for 15 years what IBM claims its AS/400 does now. We can compile in C, Fortran, RPG, Cobol, SPL and Pascal on the HP and can execute them without needing any special interpreter. We have relational and network and ISAM database structures. We can take a program compiled 10 years ago and run it on the latest machine without recompiling it.

In a nutshell, we have had (and then some) for 15 years what IBM has only recently come out with in its marketing of the AS/400. I feel sorry for those misled by your cartoonist's obvious ploy to aid IBM in perpetuating its illusions.

Colin J. Schmidt Software Analyst The Bovaird Supply Co. Tulsa, Okla.

Shakedown street

As a published author, I naturally have a vested interest in supporting any reasonable steps to combat piracy or theft of intellectual property. However, I cannot condone the shakedown tactics being used by the Software Publishers Association and cited in "SPA claims it's winning" [CW, March 12] and "Open your door or we'll sue" [CW, Feb. 26].

What happened to the principle that everyone is presumed innocent until proven guilty? What happened to the principle that anyone who is accused has the right to face his or her accus-

Both of these principles go out the window when SPA solicits anonymous accusations on a

toll-free hot line. On the phone, it is easy for callers to lie about who they are and what they've seen. Even a completely innocent company would find it unpleasant and disruptive to be exposed to an SPA audit.

Records get misplaced. It may be easier to pay whatever money Mary Jane Saunders demands than to go to the effort of locating all of the records that would prove the company innocent

Software piracy, or any other theft of intellectual property, is wrong; however, so is abusing the legal system to harass everyone you don't like. Let's remember that the end doesn't justify the means.

Alida M. Jatich Cogito Corp. Chicago

Not so fast

You said that "today's DASDs are roughly a million times faster than a 30 millisecond access time" [CW, March 5].

By rough calculation, that works out to an access time of 30 nanoseconds. I hope *Computer-world* will tell its readers where they can purchase such a fast drive

It appears that some of CW's writers and editors were decimated by decimals.

Raising the information curtain

PETER MARX

More than 40 years ago, Winston Churchill declared that an "Iron Curtain" of Communist domination had

rendered Eastern Europe separate from the "free world." Since then, Churchill's expression has come, in part, to symbolize the ways in which the Communist bloc has used information — its denial, control and fabrication — as an instrument of political power.

Now, the Iron Curtain is being raised from within. For the first time in decades, information is beginning to flow freely throughout Eastern Europe.

The effects of information deprivation, especially electronic information, have been crippling for Eastern Europe.

Though we take it for granted, information services now provides the foundation for our banking, travel and transportation systems and for many other industries. On-line information is fundamental of modern economies and progressive enterprise. Information services have become so ubiquitous that it is hard to imagine how capitalist societ-

Marx, principal of The Marx Group in Wellesley, Mass., advises companies on business deals involving information services ies could function without them. It is equally difficult to fathom how Eastern Europe can revise its economies without opening some of the same information services spigots that supply the West.

What is needed today is a new national directive designed to promote Eastern Bloc access to information services. Such a policy would benefit the U.S. as well as Eastern Europe.

A few years ago, the U.S. attempted to drape its own mantle of censorship over Eastern Europe. It was a kind of "On-line Curtain," a ban imposed by the National Security Agency on exports of all Western information services to the Eastern Bloc.

U.S. information services export curbs began in 1985 after the U.S. Defense Department argued that such access by the Soviet Union and its allies could compromise our national security. The result was former President Rea-

gan's issuance of National Security Decision Directive (NSDD) 145, which created a category of "sensitive, but unclassified" information.

The directive was based on the so-called "Mosaic Theory," which posited that on-line information services users can manipulate unclassified data to produce or infer classified data. The theory was never proven, and NSDD 145 was scuttled in 1988.

Recently, the Bush administration said it will consider lifting Eastern Bloc export restrictions ogies improving Eastern Europe's ability to communicate will further democracy, not to mention trade with the West.

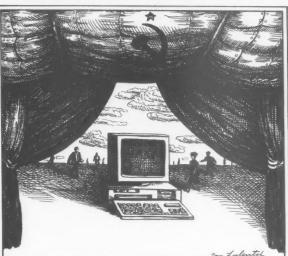

Providing the Eastern Bloc with access to Western information services would advance the U.S.' political and economic agendas by helping to interweave Eastern and Western In the long run, access to commercial information services would allow our Eastern Bloc trading partners to build bridges to Western markets and cultures. Without information services, there is little hope that they could participate actively in global trade or relate fully to Western societies, let alone be-

come economic allies.
Of course, U.S. information services providers couldn't just throw a switch and flood the Eastern Bloc with their electronic data. Many barriers still exist: The severe shortage of enabling computer and communications technologies and the problem of the ruble's inconvertibility are just two.

Clearly, just encouraging access to information services in the East won't do much to advance its use. That's why we need an aggressive policy to promote it within the Eastern Bloc.

Such a policy must promote East/West joint ventures and provide training and educational support to build the requisite infrastructures needed to apply the power of on-line services.

Promoting use of information services will hardly be a panacea for the many ills that plague the Eastern Bloc's decrepit economies. However, opening electronic data supply lines could become one pragmatic element in a U.S. program of economic assistance.

imposed by the Coordinating Committee on Multilateral Export Controls. The restrictions cover exports of computers, telecommunications equipment and other high-tech products.

Not surprisingly, information technology firms have applauded the administration's new stance. They assert that new technoleconomies. Western banks and government agencies make extensive use of electronic feeds to obtain foreign exchange rates, securities prices and other statistics. To effectively work with these institutions, Eastern Bloc banks and government institutions must have access to this same data.

For Morris, a little time in jail just might do the trick

MICHAEL ALEXANDER

A couple of weeks back, we ran a squib in "Inside Lines" at the back of this newspaper asking readers

to phone in and tell us what punishment they would recommend for Robert T. Morris.

As most people know by now, Morris is the young hacker and ex-Cornell University computer science graduate student who was prosecuted for creating a worm program and sending it coursing through a computer network.

In a matter of hours, the worm replicated to the point that it immobilized thousands of computers on Internet, the nation-wide network that links computer systems at university and government facilities.

What is interesting about our

informal poll is that all of the readers who responded suggested penalities for Morris that go beyond the maximum that the law allows. Many of the suggestions are not printable in this or any other newspaper.

Morris, released on personal recognizance, is slated to go before a judge May 4 in a federal district court in Syracuse, N.Y., for sentencing.

The law calls for a penalty of up to five years in prison and fines of up to \$250,000. Morris could also be ordered to make restitution to those victimized by the worm.

Behind bars

In my view, only a jail sentence would be appropriate punishment. Putting Morris in jail, say, for seven or eight months, would send a signal to other cyberpunks that there are sure and certain penalties for computer-related crimes.

Among the reasons that criminal hackers use computers to engage in antisocial behavior is because they are almost certain that they will go unpunished if they are caught. Few cases are investigated and even fewer ever make it into court. We can't be certain that the threat of a jail sentence will deter computer outlaws, but there is an obvious way to find out, and that is to put more than a few of them in jail.

The Morris case has shown us that we need to develop new strategies for dealing with computer criminals, especially the youngsters. One law enforcer told me that it is no longer unusual to nab 10-year-old cyberpunks attempting to break into computer systems. When confronted, they show no remorse for their deeds.

"All they are interested in is knowing when they are going to get their computers back," said a state assistant district attorney. What is also worrisome is that they go back to carrying out the same sorts of crimes for which they were caucht.

The time spent in a closetsize cell would give Morris the opportunity to ponder both the seriousness of his crime and the personal weaknesses that put him there.

When I spent several days covering the trial in January,

Morris impressed me as being both exceptionally bright and sincere. In truth, I believe that he made a mistake and did not intend to discombobulate thousands of computers.

I also got the impression that Morris thought that his need to stimulate his intellect was more important than the need to respect the rights of others. On the witness stand, he seemed at times smug and self-satisfied in knowing that he knew more about computers than most.

His failing was in thinking that his work was more important than the work of the hundreds of researchers on Internet. Evidently, Morris never bothered to look beyond the boxes to see the people who use them. All he saw was his own reflection in the computer monitor.

Some people have suggested that Morris be made to do community service. Perhaps he could learn from the experience that people count for a lot more than he seems to think. Somehow. Idoubt it.

I am not sure that there are lessons to be learned in requiring him to pay a stiff fine or ordering him to make restitution to his victims. One courtroom observer, an attorney, said to me that his defense must have cost the "better part of \$100,000." I doubt that anything would be gained by adding to this burden.

One unusual punishment recommendation came our way from a state district attorney. He suggested that Morris should be legally constrained from using computers in his employment. "These kids have been working up to the time they can use computers in their work," he said. "We should take away from them what they have been training all of their lives to do."

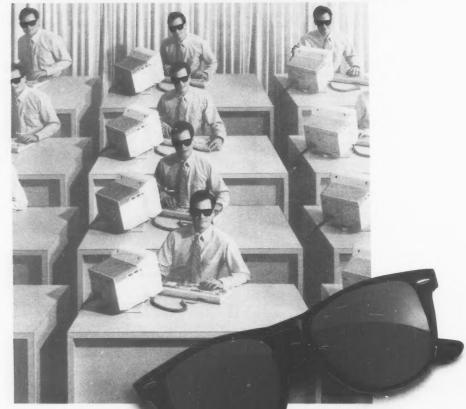

Like I said, some readers suggested punishments that go beyond what the law allows. I think that such a penalty, assuming that it could be applied, would be a marvelous deterrent to other budding Morrises out there, but in this instance, the punishment is too severe in my opinion.

Morris has an uncertain future ahead of him. No doubt there will be several companies anxious to hire him for his obvious computer skills, and he will probably be able to put this whole episode behind him some years hence.

What he will never be able to leave behind, however, is the stigma of being a felon. For that, I feel sorry for him.

Alexander is *Computerworld's* senior editor, advanced technology.

More than a breath mint

When Digital Equipment Corp. bellied up to the bar in the land of neversay-die computing last month,

hiccuped. This was what competitive

analysts at Stratus Computer and Tandem Computers stayed up nights worrying about?

Why, this puppy cost the earth but couldn't even make it tremble.

The entry-level pricetag on the VAXft 3000 was \$229,000 - compared with \$49,800 at Stratus and \$79,000 at Tandem and the DEC machine runs at barely 4 million instructions per second.

No sweat at Stratus; no tears at Tandem.

But hold on here. Could this doggie be a dark horse?

What if all 15,000 of those Vaxcluster sites out there wanted one? (While we're asking silly questions, what if Napoleon had had B-52 bombers at Waterloo?)

Actually, the only Vaxcluster sites likely to need fault-tolerant capabilities are in banking, telecommunications and manufacturing. The new VAX

Financial puzzle gets tricky

IBM's putting in more and more pieces, but can it integrate them all?

ANALYSIS-

BY AMY CORTESE

At its annual financial services industry conference held recently in Palm Springs, Calif., IBM laid out more pieces to the puzzle it calls Financial Applications Architecture (FAA).

Like the Systems Application Architecture (SAA) it is based on, FAA is a conceptual framework that IBM is filling in with products to meet the diverse needs of the financial services industry, from retail banking to trading and brokerage.

The components currently come from various IBM partnerships, with IBM planning to link them together through common standards and protocols in much the same way that it is attempting to tie together disparate operating environments and software applications under SAA. Although FAA is a superset of SAA, it also covers platforms and products not included in SAA for instance, the AIX and OS/88 environments and IMS, IBM's nonrelational workhorse database management system.

Ahead of the pack

IBM's financial services strategy is the most advanced of its vertical market strategies, but some of the ideas applied to this industry may foreshadow things to come in other areas such as health care and manufacturing, IBM officials said.

"IBM has been losing ground

in the financial industry and is trying to go vertically integrated," said Carmine Vona, executive vice-president for corporate technology strategic planning at Bankers Trust Co., a shop that spends approximately \$30 million per year each on IBM and

Digital Equipment Corp. systems. dilemma is 'The that it will take two to three years."

In the meantime, Vona said, IBM is trying to narrow the time gap by going ready-made products acquired

from other vendors and user organizations. "IBM is going in many directions. The risk is that it won't be consistent with the base architecture," he maintained. "There are all these pieces, but will they integrate? That's where the question is."

In addition to the splashy debut of its high-performance imaging system, IBM announced several new products for the financial industry, including Datatrade, a trading application for distributing data feed information; Newarc 2000, a compre-

hensive trading and development system available through Seer Technologies, Inc., a company created by IBM and First Boston Corp.; and two prepackaged data models to developsupport ment of applications

for the wholesale and trust busi-

Ray Vella

Furthermore, IBM announced an agreement with Westpac Bank in Australia to explore ways of using the bank's development tools to support IBM's financial application offerings for

retail and wholesale banking.

Add these to the handful of existing applications offered by IBM, and it really starts to get confusing.

IBM said it has been working on FAA for three years. "We are not able to do everything," said Mark Mauriello, manager of financial services industries strategy and planning at IBM, explaining IBM's reliance on thirdparty partners.

Under its long-term FAA strategy, IBM plans to have the disparate products now being offered evolve to a common set of definitions. For instance, with the recent announcements, IBM now offers no less than three application development solutions for the financial industry, not including the Westpac agreement.

However, IBM said it plans to migrate those offerings to a common set of definitions called Data Structure Series, which is built on the AD/Cycle base. IBM gave no time frame, but Mauriello said the firm "is evaluating individual models and building a plan to integrate them.'

software forecasts system needs

BY ROSEMARY HAMILTON

Hewlett-Packard Co. released a software package last week that can let customers know when their systems are no good any-

That would be the extreme, but HP RXforecast is intended to help users analyze their system requirements and forecast when upgrades and new systems purchases will be required.

The software is designed for the HP minicomputer platform. running either the HP Unix or proprietary operating systems. The company claimed it is one of the few capacity planning tools for a Unix environment announced to date.

RXforecast is actually a personal computer-based tool that works in conjunction with another software package called HP LaserRX. This package, which runs on minicomputers, allows

users to collect and review data on minicomputer performance. The actual forecasting would be performed on a PC.

With these tools users can project future requirements such as I/O performance, CPU usage and disk response time.

HP said the Unix version will begin shipping in September, while the proprietary version will be available in July.

The RXforecast software will sell for \$3,400.

GROW WITH THE STERLING CONNECTION.

From EDI to electronic funds transfer, your organization's growth is dependent on efficient, reliable data communications. From headquarters to regional offices. Between stores, warehouses and distribution sites. Across a variety of micro, mini and mainframe systems. The Sterling Connection is there. With a family of integrated software products that will streamline your communications network. And give you the edge you need for continued growth.

SUPERTRACS: Online BSC/SNA/ASYNC system for simultaneous, unattended data collection and transmission on multiple lines between a host mainframe and remote devices, including minis and micros supporting 2780/3780/3770 emulation.

TRACS: The drop in solution for BSC/SNA/ASYNC information transfer

PC-TRACS: A variety of emulation products for data exchange and file transfer between PCs, minis, mainframes and other devices.

If your organization is growing, the Sterling Connection is in your future.

With merger on hold, utility system withers

ONSITE

BY J. A. SAVAGE

SAN DIEGO — The fastest growing utility in California is caught watching one of its systems deteriorate while it awaits a merger with another utility.

San Diego Gas & Electric Co.'s (SDG&E) energy control center is run by redundant 12-year-old Gould, Inc. 32/75 minicomputers purchased from Gould before it was bought by Encore Computer Corp. in 1989. The utility had planned to merge with Southern California Edison (SCE) in mid-1988, and itscontrol center was to be absorbed by SCE's control center.

Two years later, the merger is still on hold and may never coalesce, according to the state's public utilities commission report last month stating that the merger would not be in the public's interest.

Meanwhile, SDG&E's control systems, with a power of 2.5 million instructions per second

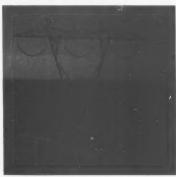

and a proprietary operating system, are limping along with only a couple years of life left in them. The systems feed data to control-room operators in a scene reminiscent of the "war room"

in Dr. Strangelove. Electrical energy from fossil fuel plants, nuclear power plants and other utilities is measured and directed to substations on the grid. Natural gas supplies are likewise measured and distributed

If the merger is called off, "We've really got a problem because [uproblem because [uprades] have been delayed so long," said former energy management system operation supervisor Phil Stockard.

While SDG&E has not been putting resources into its control systems, its business systems have

been upgraded, including IBM Personal System/2 computers for staff and fiber-optic lines linking offices. Thus, the energy control systems appear to be the technologically weak spot for SDG&E. What the utility is faced with is "a very old operating system on a very old machine," said Ron Bushner, who took over for Stockard in December.

SDG&E's control systems have just a couple years of life left in them

Bushner has met with SCE officials to discuss methods of migrating the systems over to SCE's Control Data Corp.-based environment. SDG&E is cur-

rently developing special interfaces for the two systems, according to Felipe Razo, a senior software engineer at SDG&E.

To buy a little time in the short term, he is planning an

Ethernet local-area network to connect inexpensive new hardware to the Gould systems. "It doesn't make sense to sit on our hands and lose [the systems capability] if the merger doesn't progress," Razo said.

Bushner said that implementing the LAN would not be difficult, but he has not yet determined how to keep security measures intact in such a configuration.

"We're very nervous about it, about hackers and viruses," he said. "Now there are only a few program consoles

and no ties with the outside world. With Ethernet you can get to executives and others easily — too easily." The first line of defense will be to install the

LAN only in the control systems section, he said.

While planning to eventually get rid of the Gould-based systems, SDG&E is still faced with the day-to-day maintenance of the machines, which Bushner characterized as "pretty difficult." He utilizes the 14-member in-house staff for maintenance "because they've lived with it for so long," he said.

Lots to do

Even if the merger does occur, SDG&E will have to do more than write interfaces to SCE's CDC computers. SCE is evaluating new computers for its control systems, according to an SCE spokesman, and any migration path chosen to SCE's current systems would be obsolete with a new system. SCE officials refused comment on SDG&E's potential migration, but Razo said that if the merger occurs, the current systems would be thrown out and the company would start all over.

If the merger does not occur, Bushner is faced with a dilemma from which there seems to be no timely way out. "We need a system by 1993, and we need three years to get it in," Bushner said.

Northwest Airlines flying high in clear, paperless sky

BY ELLIS BOOKER

MINNEAPOLIS — As Northwest Airlines Flight 2201 pulls away from the hangar after a routine maintenance inspection, it leaves thousands of pieces of paper in its wake.

Like the other 330 planes in Northwest's fleet, Flight 2201 is supported by hundreds of manuals ranging in size from 100 to 68,000 pages.

Northwest, the country's fourth-largest carrier, hopes to usher in a new way of handling this paperwork, which currently occupies a facility the size of a high school gym. Northwest has deployed a pair of document imaging systems that are moving it toward a paperless environment. With the new systems, technical engineers or mechanics can call up the appropriate manual in seconds to view text and graphics on a workstation.

The electronic publishing system from the Context Division of Mentor Graphics Corp. in Beaverton, Ore., allows Northwest's technical writers to revise manuals and input the revisions to those manuals. The imaging projects, collectively worth \$8 million, also put Northwest in the lead among airlines using the magnetic media they receive from airplane manufacturers, according to Northwest officials. While the digital trans-

fer of technical documents has become more common among airlines and their suppliers, work on a standard digital document format has yet to be completed.

Rendleman says document imaging system saves time

At Northwest, the search for digital document storage was sparked by its merger with Republic Airlines in Minneapolis three years ago. Republic already had a computerized, mainframe-based electronic publishing operation, while Northwest had a paper-based system.

A second incentive was Northwest's purchase of two new aircraft types: The Boeing Co.'s 747-400 and Airbus Industrie's Airbus A320.

"Airlines have received technical documentation from manufacturers on microfilm for 15 to 20 years," noted Terrence Rendleman, Northwest's vicepresident of technical operations, who directs the company's 8,650 maintenance employees.

The drawback to microfilm was lack of speed, Rendleman said. Technicians spent about 20 minutes per day using the 14-year-old microfilm machines.

"With the optical system, the retrieval time is five minutes a day," said Dennis E. Shonka, network supervisor in technical operations computer development. Shonka said the on-line system should save Northwest \$1 million per year in technician time alone.

The imaging system also brings a strict auditing function to the engineering changes that flow in and out of Northwest's maintenance department every week. Mechanics on the hangar floor can always have access to the correct documentation because the database is indexed according to type of aircraft, type of manual and the identification number of each plane.

Rendleman said the documentation of the Boeing 747-400 and the Airbus A320 — 80,000 pages in all — has been placed into the on-line system. Computer tapes from Boeing are converted from a binary format into the Mentor Graphics format via a software filter. However, Northwest would like suppliers to adhere to a common digital document format.

The Mentor Graphics publishing system resides on an 80node network of Hewlett-Packard Co. Apollo Division workstations with a combined storage

capacity of 20G bytes. A fiberoptic backbone links two buildings six miles apart and connects two 12M bit/sec. token-passing local-area networks.

Once finalized, the text and image data is indexed and written to a write-once, read-many optical disc, making the manuals available to the document-retrieval system, from Metafile Information Systems, Inc. in Bloomington, Minn., currently sports three Compaq Computer Corp. 80386-class personal computers used for indexing and scanning and six networked retrieval PCs located in one of the major hangars in Minneapolis.

An important future direction of the on-line document system at Northwest — which is still in beta testing and running in parallel with the microfilm- and paper-based records system — will be to integrate it with the workorder or parts-inventory systems residing in the airline's two IBM 3090-200 mainframes, which can now be accessed through workstation windows.

When asked how long it would take for the mainframe and workstation applications to be wedded together, Rendleman replied, "No one has ever done that. It could take a year, or two years. Our five-year plan has it as one of the first projects."

Fly with standards

irlines, airplane manufacturers and parts suppliers are about to touch down on a standard for digital technical documentation.

Technical standards committees from the AmeriD.C., based group that represents the nation's large airlines, and the Aerospace Industry Association (AIA), which represents major manufacturers of airplanes and engines, are adding a digital standard to ATA Specification 100, which governs the format and distribution of maintenance and technical documentation.

Joint ATA/AIA committees are at work on standards for automated text, automated graphics (both raster and vector) and optical disc indexing and interoperability.

Currently, vendors such as The Boeing Co. deliver technical documents in a binary format that must be converted to a format that can be read by the electronic publishing systems.

Text and graphics application profiles are planned for release into ATA Revision 29, which is due out later this year. Ultimately, electronic publishing vendors selling into the airline industry will need to adopt the ATA format.

ELLIS BOOKER

Johnson

CONTINUED FROM PAGE 27

is aimed squarely at applications in order processing, inventory management and electronic funds transfer - places where a few minutes of downtime can cost a fortune.

Like those candies that are more than a breath mint, the never-fail VAX is more than just another box.

It is a crucial piece of DEC's strategy in the on-line transaction processing (OLTP) market, where all serious players guarantee that their computers never crash. It is also a defensive maneuver to hold ground with DEC customers who might defect to Stratus.

Right now, the OLTP market hovers around \$2 billion annually, and industry experts get positively giddy about its growth curve over the next decade. By the next century, OLTP will supposedly carry the same financial weight as the \$60 billion fast-food industry.

But is the VAXft 3000 a threat to Stratus or Tandem? Get serious. Those folks have nearly two decades of success in this market between them, and a price/performance contest with either vendor would annihilate DEC, the analysts all agreed.

Yet DEC is prepared to sprinkle faulttolerant boxes up and down its product line, from the desktop Microvax to the mainframe VAX 9000. Such a move would deflate Stratus and Tandem's contentions that their product lines are superior in scope and scalability.

To users, it really doesn't matter if DEC's first foray into fault tolerance is "overpriced and underconfigured," as competing vendors sniffed. It doesn't matter if the VAXft 3000's design is a 'simple-minded hardware redundancy," as a few analysts snickered.

What matters to those legions of Vaxaholics is that it's a familiar old dependable VAX. No worries about software

conversion costs. No strange new operating systems to learn. No staff retraining costs.

One argument holds that DEC will get away with charging such a premium price for fault tolerance because the

HEN IT COMES to snaring Ma Bell's or Uncle Sam's faulttolerant business, DEC is still whistling in the dark.

places where the VAXft 3000 will sell are

already wall-to-wall with VAXs.

That "plug and go" concept is one powerful marketing vehicle, provided DEC doesn't blow it. The company has something of a reputation for overengineering and undermarketing — the flip side of IBM's approach, if you will.

Then again, the analysts and the press are hearing a very customer-oriented pitch from DEC these days. Less talk about engineering excellence and more chat about "bet-your-business" applica-

Since 1983, DEC users have reaped a respectable harvest of high availability a kissing cousin to fault tolerance with clustered VAXs that bail each other out by switching over from a dying processor to a healthy one. The company has played on the fringes of fault tolerance for seven years already, gathering valuable knowledge about what customers need and want.

That's where the "continuum" from high availability to fault tolerance comes

Both DEC and IBM, which provides fault tolerance by reselling the Stratus box as an IBM System/88, are telling customers that fault tolerance is really only necessary for critical data capture.

Mundane tasks such as storage and batch processing can be done on a highly reliable system, they argue, such as an IBM 3090, the VAX 9000 mainframe or a cluster of VAX midrange machines. DEC salespeople will probably walk in talking fault tolerance but end up selling high-availability clusters.

Yet when it comes to snaring Ma Bell's or Uncle Sam's fault-tolerant business, DEC is still whistling in the dark. Telecommunications and government business require Unix these days, and all that runs on the VAXft 3000 so far is the VMS operating system.

That raises another potential problem: DEC's database management and file systems are roped into proprietary VAX/VMS-based applications, while both Stratus and Tandem are busy chasing open systems business with Unix-based applications

When it comes to sheer staying power, however, analysts and longtime customers are betting that DEC can eventually drink everyone under the table. Cure for the hiccups, anyone?

Johnson is a Computerworld senior writer.

DOS, OS, or CICS Frustration? BIM gets it out of your

system.

BIM presents a line of proven programs that maximize your system's capabilities, saving you time, labor and expense. These program products help get the most out of your system and people. and people

BIM-VIO — DOS/VSE Virtual Disk Drive. Moves the Standard Label Area directly into memory and allows for other heavily used non-permanent files to be moved into memory as well.

BIM-PACK — Automatically compresses selected VSAM files transparent to applications and end users under DOS.

BIMWNDOW — Multiple terminal sessions concurrently at CRT under DOS or OS VTAM.

BIM-EDIT/DOS — The most powerful, flexible full screen editor available for

BIM-EDIT/MVS — All of the features of our popular DOS editor and does not require the overhead of TSO. Can be accessed directly from VTAM or from CICS or other terminal subsystems

BIMSPOOL — Prints output in POWER/VSE spooling queue on local or remote 3270 terminal printers. (Received ICP Million Dollar Award 1982).

BIMSPLSR — Optional laser printer support for BIMSPOOL. BIMSPOON — On-Line to Batch Print Spooling. Prints data passed from CICS application programs into the POWER spooling queue.

BIMSPLIT — May be used separately or with BIMSPOOL to print parts of an existing job to terminal printers at separately or with BIMSPOOL to print parts of an existing job to terminal printers at separately or with BIMSPO BIM-PDQ — POWER Dynamic Queuing performance enhancement. Eliminates 85% of the I/O to heavily used POWER queue.

BIM-PADS — Automatically alters or deletes DOS POWER spooled job entries at preset intervals.

BIM-ODIS — Comprehensive problem analysis and display of operational CiCS system. ODISTRAK is an optional historical reporting feature to be used with BIM-ODIS to generate reports relating to system usage. DOS and OS.

FF — Significantly increases the performance of VSAM er DOS by dynamically managing VSAM buffers. BIM-BUFF

BIMTEXT — Word processing, document composition system.

Create formatted documents from free-form input. DOS and OS.

BIMSWAP — Switch local 3270 BTAM terminals between multiple CICS partitions without special hardware or additional ports.

BIMCMPRS — CICS 3270 data compression system. Reduces response time for remote terminals significantly. DOS and OS.

BIM-FMAP — CICS BMS on-line map generation and maintenance. DOS and OS.

BIMECHO — Copies one CRT's output to another or printer for problem determination and demonstration. DOS and OS.

P3270 — Comprehensive CRT screen image print facility.
Copy to terminal printers or spool queue for system printer. DOS and OS. BIMSERV — On-line display of library directories and entries, VSAM Catalog entries, disk VTOC's, etc.

BINCHSOL — Multiple/Remote System Console function for CICS. Display-only or full input/display versions available.

BHMMONTR — DOS/VSE System Status, Performance Measurement, and POWER Queue display.

BIMSUBINT - On-line Job Edit and Submission facility

BIM programs are cost-efficient, some less than \$800, average \$2500. You can save even more with our group package offerings. Products are available on permanent, annual, or monthly licenses, and shipped on a 30-day free trial basis. Product documentation is available on request.

BIM also performs systems programming consulting, with consultants based in Minneapolis and Washington, D.C. Computer time services are also available on our 4331-2 system, on-eite or remote.

PARTNERS IN PORTABILITY AND HIGH PERFORMANCE

PS/2" Model P70 386

CTTT V.32 Modern

If you're automating remote field operations using IBM's new PS/2 Model P70 386, SV32 is the high-performance answer to remote connectivity with your comany's mainframe.
With SV32 installed inside the half-size

expansion slot of your P70 386, you can access your mainframe at 9600 bps from virtually any phone outlet – including your home, office, hotel room, or field sites – and run mainframe applications using standard IBM 3270, HLLAPI and

using standard HBM 32/0, HLLAPI and APPC/IJJ62 software packages under DOS and OS/2** Extended Edition Com-munications Manager. SV32 is compatible with IBM's Multi-protocol Adapter/A (so it works great in desktop PS/2s with Micro Channel* Architecturally and foctors as high Architecture as well) and features a built-in 9600 bps CCTTT V.32 auto-dial modern for synchronous communications over dial-up phone lines

And, with its innovative Virtual Modern Panel, you can instantly monitor RS232 signal activity on your display — even dur-

signai activity on your aispaip. — even dur-ing actual communications!

To find out more about the SV32 for IBM Micro Channel PS/2s, call or write to MicroGate Corporation, 9501 Capital of Texas Highway, Austin, Texas 78759.

For more information call toll-free

Users see potential in real-time Access 20/20

BY MAURA J. HARRINGTON

For a financial trader, the phrase "time is money" is taken to heart.

Compiling and updating information quickly is probably one of the most important aspects of a trader's job, and it typically is neither convenient nor time-effective to learn a new spreadsheet or software program, according to users. Enter Access Technology's 20/20 Realtime spreadsheet, now being beta tested in the financial trading market - one of the company's target markets, according to Michael Levinger, the firm's vice-pres-

ident of marketing.

The spreadsheet has received a cautiously favorable reaction from beta-test users, in part because it is the only game

20/20 Realtime is an integrated spreadsheet designed for Digital Equipment Corp.-based multiuser systems that gives users real-time data feeds, the company said. It includes features such as access to whichever database management system the DEC platform supports with the 20/20 Database Connection; trigger macros; multiple delivery modes that al-low a user to perform multiple tasks such as getting updates from wire services while working on a spreadsheet; and a driver development tool kit for low-cost, customized drivers.

20/20 Realtime is one of three realtime spreadsheets presently on the mar-

Bud Kroll, senior vice-president of Kid-

der, Peabody & Co. in New York, who has been testing 20/20 Realtime for several weeks, said, "I haven't had enough time to make an educated comment right now but my initial feeling is that [20/20 Realtime] has promise."

If Kroll's traders were to use the spreadsheet full-time, it would be in conjunction with several on-line information services and in-house software programs that must be accessed throughout the day, he said.

Beta-tester Joerg Refeld, senior technical officer for the Digital Market Data Feed system at Chemical Bank in New York, said he is also testing 20/20 Realtime and is very positive about its capabilities. However, like most software programs, 20/20 Realtime does have some shortcomings, he said.

Lack of understanding

20/20 Realtime cannot read or understand Lotus macros, Refeld said, which causes a problem for his traders because so many of them use Lotus 1-2-3 as their primary spreadsheet.

Everybody on the trading floor knows 1-2-3, but just a few of them know 20/20," Refeld said, noting that out of 250 traders at Chemical, only about six use 20/20 Realtime.

While traders currently have no other real-time spreadsheet options, Refeld said the typical user reaction at Chemical Bank is "I'm used to Lotus, but this could give me a competitive edge, so I'll learn

The traders' willingness to learn is positive, he said; however, competition from companies such as Lotus could mean a loss of interest for 20/20 Realtime us-

Refeld noted that Realtime 20/20 also lacks real-time graphics interfaces. "We would like to see real-time graphics interfaces. We have not seen it or worked with that yet," he said. Currently, when a change comes through on the spreadsheet, the user must update the graphic

The Method is only the beginning.

Creating the most widely respected systems development method in the world might satisfy other companies. But not Yourdon.

While the Yourdon Structured Method™ is still the most used and often emulated method for systems development ever devised, it is only one aspect of what we offer today.

We are constantly creating and developing new techniques and tools, which allow you to discover new solutions to software development challenges in today's ever-changing computer environment.

From advanced CASE tools to professional training and consulting, Yourdon offers a fully integrated range of products and services that improve your efficiency in producing quality work with formal methods.

So, if you think the Yourdon Method is all we have to offer, think again.

Because the Method is just the beginning of what Yourdon has to offer today.

For a free poster and complete information about Yourdon training, consulting and software, call 1-800-326-0799, or write to Yourdon, Inc., Forum II, 8521 Six Forks Road, Raleigh, NC 27615.

Similarly, the various user and customer support services offered today, such as the Officer Workbench, are expected to evolve to common Customer/User Support Services; the range of internal and external communications, such as Datatrade, will move to the Delivery and Connectivity series; and the parade of applications software, such as the Newarc 2000 and the Hogan Integrated Bank Automation, will become part of the Information series, built on a common data model.

Mann acknowledged that the task is complex and long-term: "Banks are running an application set that took 20 years to build. We're not asking them to throw that away; we're asking them to mi-

Most large banks currently operate many distinct systems that run on various platforms, noted Robert Cameron, an an-alyst at the Boxboro, Mass., office of Dataquest, Inc.: "Today, it looks like bubble gum and baling wire. It is quite a feat that [banks] get them to run together.

Platforms that integrate applications software, communications and development tools specific to a particular industry "are the winning approach in banking," Cameron said, predicting that the financial industry, and others, will see more and more of this.

"An architecture is the right way to "Vona said. However, he added, go," Vona said. However, ...
"IBM is moving exasperatingly slow. They show us the chassis and the wheels, but as a user, I want to know: When do I

Rdb and FOCUS 4GL: One is free, the other pays for itself.

Now that runtime Rdb is free, you need an application development system to make it work. FOCUS 4GL is the perfect complement to Rdb because FOCUS pays for itself in a fraction of the time of any other VAX application development product. Whether you need a transaction system to create and maintain Rdb data, or a decision support system with reporting, graphics, statistics, and spreadsheet, only FOCUS gives you a complete solution for all your Rdb applications.

COMPLETE APPLICATION DEVELOPMENT FACILITIES

FOCUS comes with a complete development toolset ready to work with Rdb. In addition to code generators and user-oriented screen and window painters, the FOCUS data management language lets you complete your application without having to rely on COBOL, C, or other 3GLs. And since FOCUS for VAX was designed for your VAX system, it is DSRI-compliant and works with ALL-IN-1, CDD/Plus, DECwindows and CIT products.

APPLICATION CONNECTIVITY AND PORTABILITY

FOCUS gives you access to all structures permitting you to load your Rdb tables directly from RMS or DBMS files as well as any other database on your VAX or IBM mainframe. And of course, all FOCUS applications are portable between VAX and IBM mainframe, UNIX workstations, HP, Wang, and PC. Your users can even have access to all IBM mainframe databases like IMS and DB2 without ever leaving the VAX.

RECOGNIZED #1 VAX 4GL

FOCUS for VAX was recognized as the best 4GL by the readers of *Digital Review* winning the prestigious Target Award in 1989. We've also been recognized by Digital as one of the earliest Cooperative Marketing Program (CMP) participants since 1985. IBI offers local helpline, national hotline, education, and consulting services from 50 offices worldwide to insure your success with FOCUS.

For more information on FOCUS for Rdb, write Information Builders, Inc., 1250 Broadway, N.Y., N.Y. 10001. Or call (212) 736-4433, Ext. 3700.

NEW PRODUCTS - SOFTWARE

System software

Graphon Corp. has released an update to its host-resident X Server software and its terminal-resident firmware.

Version 2.0 includes the backing Store and Save Under features of MIT's X.11 standard, automatic screen scrolling and additional local printer functionality. The product supports Digital Equipment Corp. Ultrix, Mips Computer Systems, Inc. and Hewlett-Packard Co. systems.

Version 2.0 is available for \$395 with unlimited site usage.

Graphon

1980 Concourse Drive San Jose, Calif. 95131 408-435-8400

Briareus Corp. has announced accounting and practice management products for use with IBM's RISC System/6000s.

The software family includes the Client Accounting and Book-keeping System (CABS), a production-oriented client accounting system for accounting offices; the Practice Time Management System (PTMS), which was designed to handle management tasks for accounting offices; and the Modular Order Entry and Inventory Management System (MODIMS) for wholesale distribution businesses.

The base price for CABS and MODIMS is \$5,000 per system; the PTMS has a base price of \$2,500.

Briareus Suite 1000 5777 W. Century Blvd. Los Angeles, Calif. 90045 213-641-3330

Computer-aided software engineering

Interactive Development Environments, Inc. has announced an integrated, multiuser computeraided software engineering environment for IBM's RISC System/6000.

Software Through Pictures runs on major engineering workstations and can be extended, customized and integrated with other tools to meet users' needs, the vendor said.

The software package is slated to be available for RISC System/6000 users in the third quarter. Single license prices range between \$5,000 and \$21,000, depending on configuration.

IDE

595 Market St. San Francisco, Calif. 94105 415-543-0900

A computer-aided software engineering normalization tool has been introduced by Six Sigma Case, Inc.

The Canonizer automatically normalizes a database design for AT&T Unix System V-based applications.

Normalizing to the third normal form, the product creates an ANSI standard SQL script for use with Unix database management systems and provides a

data dictionary containing definitions for every item in a database.

A single-user version costs \$1,295, which includes 120 days of technical support, according to the company.

Six Sigma Case Suite 210 14405 S.E. 36th St. Bellevue, Wash. 98006 800-827-4462 Synon, Inc. has announced the implementation of a price restructuring plan for its Synon/2E computer-aided software engineering (CASE) product, which is designed to support application development efforts on the IBM Application System/400 Models 10 and 20.

The base price for Synon/2E on an AS/400 Model 10 or 20 generating either RPG/400 or

Cobol/400 is now \$24,000, the company said.

Versions of the software for all other models of the AS/400 will remain priced at the current level of \$48,000, according to the company.

Suite 340 1100 Larkspur Lane Larkspur, Calif. 94939 415-461-5006

Free piggies while they last.

Prec pippies? What are those

Those are Intel's 2 megabyte piggyback memory boards. Retail value, 1995. And like we said, you can get one free. When you purchase five Intel® Above™ Board Plus 8s, now through June 30, 1990.

Of course, you get a lot more than a free piggy. You get all the unbeatable benefits of Intel's Above Board Plus 8.

What benefits? Well, in case you haven't heard, the Plus 8 is part of Intel's award-winning Above Board line—one of the most highly regarded memory expansion boards in the business. With the Plus 8, you get 2Mf8s of memory, standard. But unlike other memory solutions, the

Plus 8 can easily expand to a full 14 MBs. Which means you can run all the memory-intensive applications you need like Lotus® 1-2-3® Release 3, OS/2, like Intersoft® Windows, or anything else that might come your way.

And get this. The Above Board Plus 8 has a new low price. \$995, to be exact. That's by far the lowest price Intel has ever offered on any 2MB board! So call the dealer nearest you. Order five Above Board Plus 8s. And get your 2MB piggyback board, free.

But do it today. Because these little piggies are going to market, fast.

To get your feee 2MB piggyback board, fill out five registration cards (one per each Above Board Plus 8/Plus 8 I/O package) and mail along with copies of your invoices, dated between March 1 and June 90, 1990, to: Intel Plus 8 Promotion, P.O. Box 14070, Portland, Ovegon 97214-9949. For more information on this special offer, call 800-538-3373.

Above is a trademark of load Composition, Intel is a registered trademark of Intel Corporation. Other product narrats are registered trademarks or trademarks of their respective companies.

NEW PRODUCTS - HARDWARE

Data storage

EMC Corp. has announced an enhanced version of its Orion solid-state disk subsystem.

The reconfigured model features dynamic channel switching on each of its di-rectors, which enables Orion to support as many as four channel interfaces. It also provides 512M bytes of semiconductor storage and a Winchester hard disk backup unit, the company said.

The subsystem operates with IBM mainframes and compatible systems. It is priced from \$52,900.

EMC 171 South St. Hopkinton, Mass. 01748 800-222-3622

Emulex Corp. has introduced two enhanced small device interface disk controllers, each offering 1M byte of cache memory

The QD25 was developed for compatibility with Digital Equipment Corp.'s Microvax II, and the QD25-III was designed specifically for use with the DEC Microvax 3300 to 3900 machines. Both units support host-initiated, bad-block replacement, command queuing and prioritization and seek optimization, according to

The QD25 costs \$2,895; the QD25-III is available for \$3,095.

Emulex P.O. Box 6725 3545 Harbor Road Costa Mesa, Calif. 92626 714-662-5600

Processors

Integrated Micro Products, Inc. has reportedly doubled the performance of its AT&T Unix System V-based fault-tolerant computer.

The latest system, the XR 655, incorporates two 50-MHz Motorola, Inc. 68030 microprocessors that execute the

same stream of instructions, and each can

access up to 64M bytes of memory.

The computer conforms to the AT&T Unix System V Interface Definition and X/Open standards. Automatic diagnostic software is also provided. Pricing begins at \$130,000.

IMP 3004 Mission St. Santa Cruz, Calif. 95060 408-429-1338

I/O devices

Ideassociates, Inc. has introduced its Idea 224 series of midrange printers that support IBM's Intelligent Printer Data Stream.

The series consists of four dot-matrix printers connected via coaxial cable to IBM's Application System/400 or System/34, 36 or 38 midrange units. The printers are compatible with IBM's 4224 midrange system printers.

According to the vendor, the printers offer output that can be set for draft (400 char./sec.), data processing (200 char./ sec.) or near-letter quality (100 char./ sec.); a 32-character LCD to define options; and various text options. The products also accommodate front-, rear- and bottom-feed operations.

The series includes a black ribbon P224-02 model, which offers 64K bytes of memory and a 400 char./sec. print speed (\$5,995); a black ribbon P224-F1 with 200 char./sec. print speed (\$4,195); a P224-E2 512K-byte version (\$6,495); and a 512K-byte P224-C2 color printer (\$6.695).

Ideassociates 29 Dunham Road Billerica, Mass. 01821 508-663-6878

Ideassociates' Idea 224 printers are compatible with IBM's midrange line

Force Computers, Inc. added two singleboard CPUs to its VMEbus CPU line.

The CPU-40 and CPU-41 offer application-specific daughterboards, dubbed Eagles, which connect to VME baseboards on a Force Local Expansion Interface. The interface then connects the Eagles to a main VME board on a 270-pin connector. Both boards feature 25- or 33-MHz Motorola, Inc. 68040 microprocessors linked pin-for-pin via a cycle control chip to an FGA-002, a Force gate array.

The CPU-40 can address up to 16M bytes of dynamic random-access memory (DRAM), while the CPU-41 contains up to 4M bytes of static RAM.

Pricing for the boards ranges between \$4,000 and \$10,000, depending on options and production prices for the 68040 chip. A 25-MHz CPU-40 with 4M bytes of DRAM and an Eagle-01 costs \$7,995. Beta-test samples are scheduled to ship in third-quarter 1990. Volume production and shipping is slated for fourth-quarter 1990.

Force Computers 3165 Winchester Blvd. Campbell, Calif. 95008 408-370-6300

THE BOTTOM LINE: IS THE WORLD READY FOR UNIX?

DESPITE A TROUBLED BEGINNING IN THE 1970s

AND '80s, UNIX HAS BECOME A RISING STAR IN THE

COMMERCIAL WORLD. INTERNATIONAL DATA

CORP. (IDC) EXPECTS THAT UNIX, IBM'S MVS.

DIGITAL EQUIPMENT
CORP.'S VMS AND
MICROSOFT CORP.'S
OS/2 WILL BE THE
PREDOMINANT OPERATING SYSTEMS FOR
COMMERCIAL APPLICATIONS IN THE 1990s.
IDC'S SURVEY OF 129
COMMERCIAL COMPU-

TER SITES CONDUCTED IN THE LAST TWO MONTHS
OF 1989 INDICATES THAT UNIX IS USED FOR
COMMERCIAL APPLICATIONS AT 84% OF THOSE
SITES. AS ILLUSTRATED IN TABLE 1, THESE
APPLICATIONS RANGE FROM ON-LINE TRANSACTION PROCESSING (OLTP) TO DESKTOP
PUBLISHING TO PROJECT MANAGEMENT.

as a further indication of the commercial world's acceptance of Unix, 70% of MIS managers surveyed stated that they had purchased off-the-shelf, shrink-wrapped Unix solutions for their business problems.

UNIX: NOT JUST A SOFTWARE

Though Unix is usually thought to be a software issue, software is only one-half of the picture. In the early '80s, few people would have believed that IBM would be selling a Unix operating system for its mainframes by the end of the decade.

As the production of open systems continues, one can expect Unix to shine. All major hardware vendors, including those that have been notoriously closed in the past, have announced versions of Unix for their platforms. Some companies have announced complete hardware lines, such as Data General Corp.'s Aviion and DEC's Decsystem, that will run Unix but will not run their proprietary operating systems. In the 1990s, IDC expects the hardware vendors to play a larger and more supportive role in continuing the Unix revolution.

While workstations and minicomputers were the traditional Unix platforms of the late 1980s, the workstation sector's growth rate has slowed down significantly. This should not be considered a sign of a slowdown of the Unix market but rather an encroachment of microprocessor-based

Unix systems. IDC estimates that the growth rate of Unix in 1988, for workstations and minicomputers, was 7% and 10%, respectively. The 1988 market value for the workstation and minicomputer markets was calculated to be \$2.2 billion and \$1.7 billion, respectively. There is no data yet available for 1989.

With the widespread availability of Intel Corp.'s 1386 and 1486 micro-processor personal computers, Unix finally has a suitable hardware platform available for the desktop systems. With products such as Santa Cruz Operation's Xenix, the growth rate among Unix PCs in 1988 was 62%, compared with 19% for all PCs. This \$3.63 billion market comprised 42% of the \$8.53 billion overall Unix market.

As Unix gained commercial acceptance by mainframe users, the Unix mainframe market value growth rate was driven to 30%, generating a \$1 billion market.

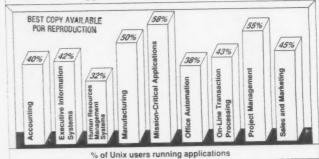

Table 1 Eighty-four percent of the 129 commercial computer sites surveyed by IDC said they are using Unix for commercial applications. Mission-critical applications were the most common, followed closely by project management.

During the same time, the overall mainframe market value grew by only 9%.

In all, the Unix market captured 10% of the 1988 aggregate computer market value. The 29% Unix growth rate was significantly higher than the 7% rate turned in by the overall computer market.

ISSUES OF 1990s

In order for a company to successfully compete in the 1990s, IDC's ongoing research has identified five areas of concern that must be addressed by the IS manager:

 The connection and management of distributed data resources.

2. The production of OLTP systems.

The identification and development of mission-critical applications (MCAP).

 The increasing use of executive information systems (EIS) and decision support systems (DSS).

The implementation of enterprise solutions and standards (ESS).

Each of the five elements must be successfully managed by the IS manager. The successful IS department of the '90s will

need a computer system that does more than solve today's problems; it must be sufficiently flexible to handle problems that have not yet been considered. Of today's widely accepted operating systems, Unix's flexibility is unique in that it does meet the demands of today and tomorrow. Unix will continue to grow in both installed base and market share.

Unix market value and market share

Total Market \$8.53 Billion in 1988

For 1988, IDC says personal computers dominated the Unix market in terms of market value and share of market. PCs accounted for \$3.63 billion in revenues and garnered a 42% market share. After PCs, the bigger the machine, the smaller the dollar value and share of market.

Why Unix?

Although Unix celebrated its 20th anniversary in 1989, the operating system has only been commercially supported since 1983. Originally developed by AT&T as an interactive, multitasking development system for the experienced programmer, it has evolved into a commercial-strength production operating environment.

Due to its wide availability, Unix became the de facto hardware-independent platform. Thus, it became the paradigm of federal procurement specifications. Only one of the sites surveyed by IDC, however, indicated that federal specifications influenced their Unix

purchase decision.

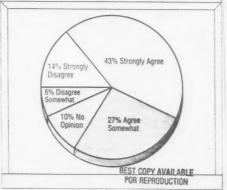

The driving force behind Unix is its ability to run a multitude of platforms. Because the majority of the Unix operating system is written in C, a high-level language, Unix may be ported to other platforms as soon as a C compiler is available for the target computer. Theoretically, it is then possible to take an application that was developed on a Unix microprocessor-based computer and have it run in a Unix supercomputer production environment and vice versa, with just a compile and link of the source code on the new platform.

A different Unix for every vendor Being written in a high-level

language is both an advantage and a drawback for Unix. Users who bought the rights to the Unix source code could and did modify its original functionality. Because of the efforts of countless computer science students at institutions such as the University of California at Berkeley, variations of Unix were created and evolved. From the efforts at Berkeley came a succession of Unix versions, the latest being Berkeley 4.3. At the same time, AT&T also continued to enhance its Unix, releasing System V Release 4 in November 1989.

As a result of these two major versions of

Response to "Unix is my operating system of choice for addressing my business problems in the 1990s."

From its relative seclusion of the 1980s, Unix is poised to take the center stage of the '90s, according to a 50% majority of those polled.

Unix, AT&T and Sun Microsystems, Inc., a major Unix-based workstation manufacturer, announced that they would jointly develop new versions of System V. Fearing that Sun would have an unfair competitive advantage, the Open Software Foundation (OSF) was created to develop a Unix that would compete with the AT&T/Sun product. The seven original OSF sponsors were Apollo Computer, Inc., DEC, Groupe Bull, Hewlett-Packard Co., IBM, Nixdorf Computer Corp. and Siemens AG. Since its inception, over 150 organizations have joined OSF.

As a response to OSF, Unix International

(UI) was then formed to act as an advisory panel in assisting AT&T in the ongoing development of System V. There are more than 100 members of UI, including Amdahl Corp., Control Data Corp., Fujitsu, NCR Corp., NEC, Prime Computer, Inc. and Sun.

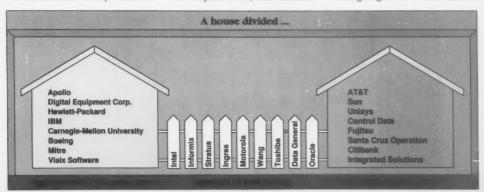

Though the founding members of both OSF and UI tended to be primarily hardware vendors, many software vendors and end users have also joined the standards organizations. The addition of the software vendors and end users gives both organizations a well-rounded perspective in generating their final product: a Unix that meets the needs of the hardware manufacturer, the software developer and the end user, not just one special interest group.

Membership in one standards organization does not exclude one from belonging to the other group. Dual membership status is held by such companies as Data General.

Motorola and Stratus Computer, Inc. among others.

Are the conflicting standards significantly delaying Unix purchases? When IDC asked this question of IS managers, 68% indicated that the differing standards had little or no effect on their current Unix purchases. However, 25% of those polled stated that the conflicting standards were delaying their Unix acquisitions.

The respondents to IDC's census indicated that they were not really interested in what version of Unix they were running. Regardless of what version of

A house divided: The Open Software Foundation and Unix International both tried to control Unix development. Nine companies made sure that they would be on the winning team by joining both of the competing factions.

Data General's AViiON lets you run both.

When you're looking for solutions, choose the UNIX* system-based RISC platform that scores of industry leading software vendors have already chosen: Data General's AViiON* Family!

There's a deep set of proven utilities, databases, and 4GLs that make developing or porting your own programs as easy as can be. And there's a broad range of applications for industries like banking, insurance, hospital management, accounting and more.

Data General supports the 88open BCS, the

industry's only binary standard for multivendor interoperability. That means AViiON is open to the most important networking, communications, and software standards.

Call 1-800-DATAGEN and we'll send you a brochure listing hundreds of third-party software programs available for Data General's AViiON Family.

Data General
3400 Computer Drive, Westboro, MA 01580

Unix they are running, IS managers are interested in only one thing: Are there solutions to my business problems on the platform that I have chosen? IDC believes that this will be the trend of the 1990s. Sell me the solution to my problem, then sell me the Unix platform that it can run on.

Distributed Data Resources

Pity the IS manager of the '80s. Yes, the use of his computer has grown. The machine behind the glass wall has burgeoned along with his staff and budget. But as he has looked into the land of the users, he saw them leading a revolution.

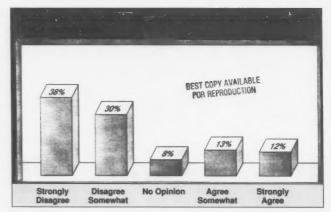

The revolution started 10 years ago, with little fanfare, as one department bought a minicomputer for some esoteric use. The IS department promised a turnaround time measured in months, while the departmental computer was able to deliver in weeks. Then another department bought a couple of personal computers for word processing and something called "spread-sheets." But since he still had a large backlog of programs to develop, the IS manager felt safe in knowing that users would eventually come to him for leadership.

As the decade continued, the departmental minis grew in capability and personal computers multiplied. Some departments went as far as hiring support personnel for their systems and installing networks to allow their PCs to communicate. Managers, particularly those from the finance office, began to notice that there were large quantities of both redundant data and resources being sequestered in each system.

The edict given to the IS manager for the 1990s is "Eliminate the redundancy." He will no longer manage a strictly centralized resource but will incorporate the glass house of his mainframe into the neighborhood of minis and PCs. While doing so, he will need to continue giving the user the power and flexibility he had in the past and refuses to give up.

No man is an island, and neither is the computer in the 1990s. As noted earlier, Unix was designed to be the great communicator. Though its original communications were with users via teletypes, it soon allowed computers to communicate via networking.

In some situations, it may be sufficient only to attach terminals to a host; other situations will demand more complex solutions. A number of workstations may be connected together in a local-area network linking a minicomputer in Hong Kong, which may in turn be connected to a

Most potential Unix users are not put off by conflicting Unix standards. More than two-thirds of those surveyed would not let the situation prevent them from purchasing.

New York-based mainframe via a satellite link. The workstations may be requesting digital information that is stored on both compact-disc read-only memory and conventional magnetic media, and news from live wire feeds. Unix is already in place and successfully handling these situations. IDC expects Unix to support the technologies of the 1990s and carry the commercial world into the future.

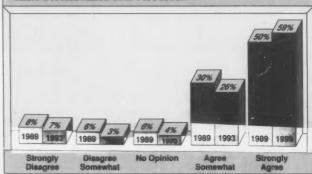

From both the end user's and developer's perspective, a networked Unix computer system should appear to be just one machine. Therefore, as in a well-managed nondistributed system, a given

piece of data resides in only one location on the Unix network. All applications needing to access the data, for example, a customer profile, will merely reference the data. In the past, each departmental computer would have maintained its own copy of the customer profile. This model would not promote high data integrity, as each system site would be responsible for maintaining the data.

Projections from the glass house

IDC's findings indicate that most keepers of the glass house have found that Unix is keeping the masses satisfied, even happy.

Response to "Unix is my operating system of choice to unite decentralized data resources."

By 1993, almost 90% of those asked expect to implement Unix as the operating system of choice for unifying decentralized resources.

An overwhelming 80% agreed that Unix was their system of choice for unifying decentralized data resources. Only 14% did not. By 1993, 85% expect to be using Unix to tie together assorted data resources.

With the assistance of a little hardware and software, it is usually not too difficult to get computers to communicate with one another on an infrequent basis, as exemplified by the client-server model. On the other hand, it has been extremely difficult to have systems communicate efficiently enough to realize cooperative processing. Cooperative processing is the division of a large program that runs on one processor into subprograms that run on many processors. However, the division of labor requires that the different subprograms be able to communicate quickly and efficiently. Most Unix computers and network systems have been designed with this goal in mind.

Today, there are about the same number of Unix and non-Unix systems running distributed processing applications. MCAPs were the exception in 1989. Of the users running distributed processing MCAPs, only 37% were running them on

distributed Unix platforms. In 1993, IDC does not expect the picture for distributed MCAPs to change significantly. However, Unix-based OLTP distributed systems and EIS distributed systems will lead non-Unix-based distributed systems in market share. IDC expects distributed Unix-based OLTP applications to outpace other distributed OLTP systems by 40%. Though distributed EIS systems will lead by a smaller margin, their 28% lead is still impressive.

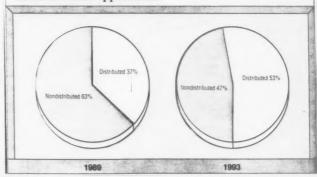

Distributed systems have existed for nearly 20 years, but they are difficult, at best, to implement. However, networking is finally coming of age for more and more shops. As Unix - one of the most powerful tools for both development and production of distributed systems - becomes accepted and develops a history with the MIS community, the corporate world can expect to see more cooperative processing systems in production.

ON-LINE TRANSACTION PROCESSING AND THE PROBLEMS IT CREATES

OLTP enables users to process a transaction and receive a response in two to three seconds 100% of the time. Air travelers use OLTP systems every day. The request for flight information, seat selection and payment via a credit card are all transactions that must be accomplished in seconds to satisfy the customer.

On the high end, American Airline's

Distributed systems vs. nondistributed systems in Unix mission-critical applications

During 1989, 37% of users running distributed processing MCAPs are expected to do so on distributed Unix platforms, while 53% are expected to do the same by 1993.

Sabre system routinely completes 2,000 transactions per second across a wide-area network. On the low end, and more typical for most operations, is the point-of-sale terminal. This system can deduct an item from inventory in one transaction and check on the customer's credit line in the next. The OLTP system in this instance may only be asked to complete two or three transactions per minute.

The marriage of OLTP and Unix is not without troubles, but they are capable of being mended by a good marriage counselor, such as an independent software vendor. Though off-the-shelf Unix was not

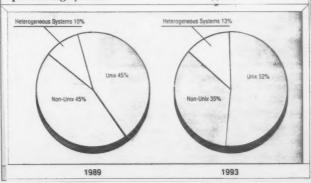

originally designed for transaction processing, both independent vendors and AT&T have been able to offer enhancements to upgrade Unix's OLTP performance.

Buffers for the disk I/O

In the interest of performance, Unix maintains a buffer for disk I/O. The actual I/O to the disk is not performed until the buffer is full. If the buffer is corrupted before the data is written to the disk, the information that the application believes has been written to the disk has not been.

With the release of System V Release 4, write-through buffers are available. A disk

System configurations of on-line transaction processing systems

Unix is forging its way into the on-line transaction processing environment. IDC projects a 7% growth spurt from 1989 to 1993.

POR REPRODUCTION

A Data General Perspective on the Emergence of Open Architectures

Reprinted with permission of DG Review; based on an interview conducted between Steve Knight and Stephen R Baxter, Vice President Corporate Marketing.

Q: As a company, Data General Corporation has developed a strong standards position very quickly. What is responsible for this change in corporate philosophy? Baxter: I want to make sure we have a definition of standards here—it is not just communications and not just open architectures. Bringing true openness and connectivity to Data General's AViiON." Family is a fundamental aspect of that. You can look at it on four or five levels—first, it allows R&D to develop or procure products that truly meet standards, and ensures that those standards remain inviolate. Second, from an engineering and manufacturing point of view, hoving industry standards like SCSI or VME buses allow us to take the latest technologies and integrate them into our system. Third, by having a commitment to standards, we allow customers to pick and choose components as they put our systems in some embedded fashion into a final solution. At the next level, it allows VARs, ISVs, master VARs and distributors to pick and choose hardware and software to integrate because we clearly define where the interfaces are in terms of standards. Finally, it gives end users the best of all worlds. Having all those attributes of openness and interconnectivity really enhances their ability to read in putting the right information systems together to solve their management problems.

Q: As computers become more of a commodity, how does Data General add value?

Baxter: You picked one of the key issues, which is how do you handle the intellectual dichotomy of adding value in a standards world? Certainly the shiring example of that has to be the operating system, DG/UX". Data General's DG/UX rigorously meets all the standards of AT&T, POSIX, etc. In addition, it has a very robust file system, symmetric multiprocessing, short-term and middle-term scheduling. What we've done is give people commercial-grade capabilities they're used to in an operating system, so if an organization decides they're going to be open, they don't have to give up all those capabilities. We give them the best of all worlds, and they don't have to give up anything to get there.

What we do is look at the value-added applications from a communications and operating systems point of view and say, "Here are ways we can differentiate ourselves over and above what's offered on the marketplace today."

One capability in terms of standards is that as a member of the 88open consortium, if someone develops an application to the only RISC-based multivendor BCS that exists in our industry (the 88open BCS), and in two years someone decides to move, they can take that application and run it—without change, without recompilation, without modification—on the other vendor's systems that (support) that standard. What we've done is make it very aftractive for someone to port applications to our system because it has immediate multivendor portability. It is binary compatible; we have to clearly focus our value-added capabilities (on the) scalability of our systems, from a workstation to a multiprocessor server and higher systems. We think we can go in the standards world and focus on those value-adds, and that's where we're making our investments in R&D.

Q: There have been comments to the effect that binary compatibility is an ideal that is years away from reality. Care to comment on the accuracy of that? **Baxter:** I think that opposed to giving you some nice marketing answer, let me give you a practical example of what Motorola did recently. They took an application that happened to be running on a 68000, used a cross compiler on an 88000, ran it on their machine—no modification, no recompilation, no man-machine intervention, and ran it on machines of five other vendors, including Data General's, without change. No problems—zero, zip. none.

Q: What place is the workstation going to play in Data General's future, and in computing in general in the next several years?

Q: How do you compete in the global marketplace?

Q: You have a fine line to walk with your installed base and who you're looking at as new customers for your AViiON computers—on the one hand having to convince customers that the ECLIPSE® MV/Family will be supported, that you'll keep R&D up to a certain level, and on the other hand, putting a lot of resources into the AViiON line. How would you grade yourself so far?

Q: Would you care to consider what computing might look like in five years?

Q: Can you briefly touch on what your Distributed Applications Architecture (DAA) strategy is and how you see it unfolding in the next few years?

Baxter: We strongly believe that more people are going to want and/or demand the kind of computing capability workstations can provide. It is overwhelmingly clear that the desktop is going to be the fastest growing part of the marketplace. We think the price/performance and connectivity story of our AVIION product line, and a cost-effective PC line is how we can capture the desktop, which is one of the keys to our long-term growth. It's not just with the AVIION, it's not just with terminals. it's not just with PCs—you have to satisfy a broad range of users who have different needs, and you need that type of broad-range capability and performance to do that and integrate all of them into existing networks.

Baxter: You have to make sure that whatever the standards are, you meet them. You need what I call a "Jacks or better" approach to play in those marketplaces. You make sure you are part and parcel of the teams that are making the standards, and you make sure you have quick time-to-market implementations of those standards. I think we have consistently shown that we are as fast, if not faster, in terms of time-to-market, concept-to-delivery of a product than most major vendors.

Baxter: Those are not antagonistic strategies; they're very complementary. There are many ECLIPSE MV/Family customers who are going to be ECLIPSE MV/Family customers rom now, and for whom (AViiON) is not an issue. There are some quite large ECLIPSE MV/Family customers who are looking toward open systems in terms of new applications, and we have a strong story in interoperability between our AViiON and ECLIPSE MV/Family lines. We think it is fundamentally easier to implement a Data General UNIX" system-based solution in an ECLIPSE MV/Family network than any other UNIX system-based solution, so we think (customers) can have the best of both worlds—if you want the price/performance and growth capabilities of the ECLIPSE MV/Family for the rest of your natural life, that's available to you.

If there are certain situations where open systems may be more appropriate, you can do that with Data General. We are not spending one dollar of R&D to push a migration from the ECLIPSE MV/Family to the AViiON Family. We're spending lots of dollars in R&D to make the interoperability story as compelling as possible.

Baxter: I think we'll see dramatic changes in the adaptability of the manmachine interfaces, and extraordinary transparency in client-server models. The intelligence of the network will allow us to look at systems of computers as a single networking entity, and the most appropriate place for the data to reside and to be run will be masked from the user, and that goes a long way toward achieving the promise of true distributed computing. We call it Distributed Applications Architecture.

Baxter: There are a couple of key aspects. First of all, it allows for very smooth interoperability in a homogeneous environment, i.e., Data General's PCs, communications, UNIX and proprietary systems working together. Second, it really plays off the capability of working in a multivendor environment in a very transparent fashion. Third, it marries various technologies such as graphical user interfaces, PCs, and ECLIPSE MV and AViiON Families and does it in a way which is technologically advanced but masks the technology from the end user. We think it's very important to smooth over, if you will, the kinds of man-machine interfaces that exist. Lastly, DAA is truly based on standards, and having that openness and interconnectivity as a fundamental part of our strategy allows the user to bring in whatever solution is appropriate. Any vendor who subscribes to industry mandated standards or to de facto standards can bring that (solution) into the DAA environment.

◆ Data General3400 Computer Drive, Westboro, MA 01580

system with a write-through buffer is written to every time a write is requested; it still maintains a buffer for extremely fast reads. The advantage in data integrity on the disk outweighs the insignificant loss in the throughput of the OLTP system.

In addition to the write-through buffer discussed above, the disk may be accessed in "raw" mode; i.e., writing directly to the disk without using the Unix I/O system. While having the advantage of being faster than write-through buffers, raw mode has the serious disadvantage of being device dependent. This dependency wastes the key benefit of Unix: software portability. It also restricts the use of the application to those systems that have the exact hardware configuration that the application was developed on.

A transaction processing monitor provides a profile of system resources used by the OLTP application. The profiling data then allows the system to be fine-tuned for execution efficiency, availability and disaster recovery. Standard Unix lacks a transaction monitor; however, one is available from AT&T's Tuxedo OLTP package. Though vendors may be tempted to write their own monitor, such an effort is justifiable only for large-scale applications.

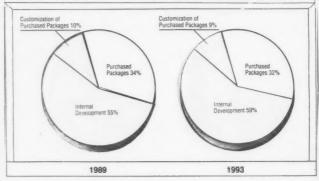

Unix/OLTP projections

A fault-tolerant system compensates for failed components, allowing the system to survive. In most cases, the work is divided among the other components. Most current flavors of Unix are not fault tolerant, but they should be. Most OLTP applications are critical to the mission of the enterprise: Any downtime for the application affects the bottom line. However, it should be interesting to watch the development of Mach, a version of Unix developed at Carnegie-Mellon University that features parallel processing enhancements. OSF has adopted Mach as the kernel for its OSF/1 operating system.

Despite the apparent drawbacks of using Unix in an OLTP environment, 45% of the OLTP sites surveyed by IDC were using Unix as their exclusive OLTP platform. An equal number were running OLTP applications canon-Unix platforms. By 1993, IDC projects that 52% of the OLTP applications will be on Unix platforms, compared with 35% on non-Unix platforms in the polled sites.

Shrink-wrapped OLTP applications present an area of opportunity for vendors. While 81% of Unix OLTP sites surveyed said that packaged Unix solutions could solve their general business problems, only 34% had actually purchased an OLTP package. For the most part, OLTP is an

Development of Unix for on-line transaction processing systems

Users who favor internal development of Unix for their on-line transaction processing systems will be a growing majority between 1989 and 1993.

application field where the enterprise plans to go it alone both now and in 1993. According to IDC's survey, 55% of Unix sites are currently running internally developed OLTP applications. In 1993, that number is expected to increase to 59%. For the vendor that is able to bring OLTP applications to market, the rewards should be substantial. As a point of reference, 39% of non-Unix OLTP sites are expected to be running internally developed OLTP applications in 1990 and 1993.

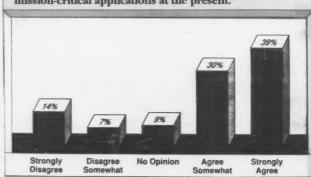

Presently, some 60% of Unix OLTP applications are integrated with other applications, e.g., accounting, publishing and human resources management

systems. However, over the next three years, IDC believes that up to 80% of Unix OLTP applications will be integrated with both MCAPs and EIS/DSS. IDC attributes this high degree of future integration to the goal of OLTP: processing information on a real-time basis. The company that can disseminate information to both managers and employees as it is requested will not only survive the 1990s, it will thrive.

MISSION-CRITICAL APPLICATIONS: THEY COME UP AND THEY CAN'T COME DOWN

MCAPs by definition are critical to the success of the organization. They are

Responses to "Unix is my operating system of choice for mission-critical applications at the present."

Mission-critical applications (MCAP) are all the rage, and 69% of users agree Unix is their MCAP operating system of choice.

BEST COPY AVAILABLE
POR REPRODUCTION

usually specialized to permit the firm to exploit the niche in the commercial world it competes in. Consequently, one firm's mission-critical application may be another's prosaic application. Such is the case with payroll. While it would be an inconvenience if the payroll was to crash while in production for a manufacturing firm, it would be a near-disaster for a firm whose business is producing payroll checks.

Because the success of the enterprise lies in part on the MCAP, one would expect firms to contribute significant resources toward keeping the application on the cutting edge of technology. Evidently, they believe Unix is that technology. Of the sites interviewed, 69% either strongly agreed or agreed somewhat that "Unix is my operating system of choice for mission-critical applications in

1989." IS managers indicated that their use of Unix-based MCAPs will experience a 10% growth rate by 1993.

MCAP projections

At the sites that have implemented MCAPs, one-half of the applications have been installed on Unix platforms, while another 12% reside on both Unix and non-Unix platforms. By 1993, IDC expects the growth rate of both the Unix homogeneous sector and the Unix/non-Unix sector for MCAPs to be approximately 14% and 25%, respectively.

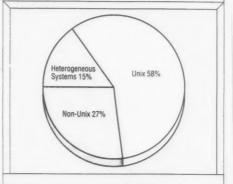

IDC expects that many more MCAP's will begin to incorporate new software technologies, such as expert systems. Most of these new software technologies come from research institutions, the traditional heavy users of Unix; because of this, many more corporations will accept Unix as their MCAP platform.

One of the traditional complaints about Unix is that it is not stable enough to run 24 hours a day, seven days a week. This is not reflected by the fact that 63% of MCAP installations in the survey were on nondistributed Unix systems. In placing their all-important MCAPs on nondistributed systems, the installations were wholly placing success of their corporation on Unix platforms. These companies obviously have a strong faith in Unix.

EXECUTIVE INFORMATION SYSTEMS AND DECISION SUPPORT SYSTEMS

Commercial Unix offers a new set of solutions to EIS and DSS users. These users

Mission-critical application system configurations in 1993

By 1993, 58% of those sites implementing mission-critical applications will have them running under Unix.

- typically senior corporate officials and planners - require efficient systems capable of linking diverse networks and collecting information from far-flung corporate environments. Unix is finding a niche in two ways. First, cost-effective Unix systems are an attractive alternative to mainframe-based EIS and DSS systems. Second, Unix offers a possible solution for IS executives who must integrate data access across a broad spectrum of information processing environments.

EIS/DSS applications are used to improve organizational decision making. Therefore, these applications can help users translate information assets into corporate profits.

EIS and DSS come of age

Both EIS and DSS grew up in the IBM mainframe environment. Decision support packages trace their lineage to the late 1960s. Modelers and financial planners recognized that modeling packages would allow them to rapidly access and analyze corporate information stored on centralized mainframes. DSS applications grew as more information found its way to these central repositories.

Commercial EIS applications emerged in the 1980s as a response to executives' increasing requirements for faster access to corporate information in more usable formats. The evolving distributed information technologies have facilitated both the rapid access and graphical display of corporate information.

However, the same technologies that have facilitated both EIS and DSS growth will complicate the task of obtaining corporatewide information. IS managers have adopted distributed systems as a cost-effective and user-friendly solution to reduce mainframe backlog and multimillion-dollar price tags.

Distributed systems, however, mean distributed information. Therefore, ElS and DSS users need an equally inexpensive distributed capability to access and process this corporate information, a role that Unix fits quite nicely.

Vendor moves

EIS and DSS vendors recognize the emerging importance of the commercial use of Unix. DSS vendors began porting their products to the Unix world several years ago. EIS vendors are poised to follow.

Both SPSS and SAS have ported their products to Unix and are presently enjoying the fruits of their labor. Indeed, SAS's Unix product is one of their fastest growing.

Other leading DSS vendors are also preparing inroads into the Unix market-place. Execucom Systems Corp. recently announced Paradigm, which is expected to compete heavily with Data Interpretation System from Metaphor and IBM. Paradigm offers a combination of spreadsheet, data access and presentation tools.

In the EIS arena, Execucom's Executive Edge is currently running on a multitude of Unix platforms. Also, Pilot Executive Software has announced a version of Command Center, its popular EIS package for HP/UX, HP's Unix environment. These systems will be effective in client-server environments as well as in more traditional organizations.

EIS/DSS projections

Although it is slowing, internal development has been and will continue to be a popular choice among those planning new EIS installations. Recent IDC research indicates that about 50% of all EISs are developed internally. The rich set of development tools in the Unix environment makes it a natural for EIS developers. Over 60% of all Unix users viewed Unix as the operating system of choice for EIS and DSS systems.

Unix's appeal as an EIS/DSS operating system is evidenced in user plans for

future systems. As the table beside illustrates, the percentage of users with EIs/DSS installations on Unix platforms will increase from 42% to 54% over the next four years, while at the same time non-Unix platforms will decrease from 49% to 33%. Commercial users with Unix experience view Unix as a strong platform for EIs/DSS applications.

Unix users are finding it easier to install EIS/DSS packages. New products from EIS/DSS vendors will significantly reduce the amount of internal EIS/DSS development in user shops. Internal development, which accounted for over 50% of all EIS/DSS installations on Unix systems in 1989, will only represent 45% of applications in 1993. Clearly, users will take advantage of new application packages for their Unix systems.

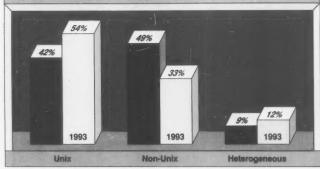

ENTERPRISE SOLUTIONS AND STAND-ARDS: THE PUSH FOR COMMON INTERFACES AND PLATFORMS

Consider the challenges of having three different types of computers with seven applications from assorted vendors all running under the same roof and sometimes by the same person: 1. The function key on one application is used for help, while on another application, it is used to delete. 2. With each new computer system, both the support staff and users need to be retrained. 3. Applications from the old system have to be reengineered to run on the new system. 4. Who will support the system when the vendor no longer will? The time and aggravation you have spent solving these problems have cost your organization only one thing: money.

The implementation of ESS saves money by reducing the time and cost of procurement and training. Training costs are not only reduced at the departmental level but also at the enterprise scale. The IS department and the rest of the firm will not have to be sent away to workshops for retraining.

Large numbers of firms will continue to migrate to Unix to aid their quest for ESS. Of those Unix sites surveyed, 73% agreed that Unix has made such standards possible. Among the IS managers that have implemented Unix-based ESS. Unix was chosen over VMS, MVS, OS/2 and MS-DOS for three reasons. First, Unix is the only major multiuser, multitasking operating system available on systems ranging in size from personal computers to superfrom personal computers to superfrom

Computer system configuration for executive information systems and decision support systems

Top management will increasingly depend on Unix for their executive information systems and decision support systems.

computers. Second, Unix has very good communications and networking capabilities. Third, Unix provides a standard that is largely hardware and software vendor-independent.

However. Unix is a product of AT&T. Companies that want to modify their Unix operating system are required to buy source code from AT&T. and a license fee must be paid with every sale. Therefore, Unix is essentially a product being provided by a single vendor. IEEE's Posix defines a Unix-like operating system available from a number of software vendors; it may help move the industry away from relying solely on AT&T.

Saving money with ESS

Unix is unique in that it is an operating system supported by a large number of software and hardware vendors. Rather than being locked into a short list of suppliers, users can choose from a long list of suppliers. The greater number of competitors encourages the vendors to keep their prices down and maintain a high quality level of product and service.

ESS projections

Unix opponents continue to argue that its competing versions prohibit the operating system from being a building block of ESS. IDC's findings dispute that belief. Sixty-four percent of Unix sites surveyed agreed that they are currently able to move applications seamlessly

from one Unix platform to another. Only one-fifth of those surveyed indicated that it was difficult for their organization to move applications among different Unix platforms.

IDC's research also indicates that only one application area, office automation (OA), is currently enjoying major benefits from ESS while competing standards have hindered the penetration of Unix as an effective ESS market player.

THE BOTTOM LINE

Unix is ready to accept the commercial world. Is the commercial world ready to accept Unix? Those in the know already embrace Unix as their solution to the problems facing the world of ISinthe 1990s. Those who ignore the Unix phenomenon will be left behind in this new decade.

IDC expects to see a unified Unix product from OSF and UI by the end of 1993. Should users delay Unix purchases until then? No. As in the past, the joint product operating system will be backward-compatible with existing versions. Therefore, if the solution to your business problem already exists under Unix, do not delay your purchase.

Unix is the operating system that will solve the problems of the 1990s; it stands tried and tested before you today. The MIS shops from a variety of industries that have already implemented Unix-based business solutions are succeeding today and will be thriving tomorrow. Δ

Why is COMPUTERWORLD the <u>best read publication</u>* among MIS executives in America?

Because it's the only weekly computer newspaper to offer complete coverage of every aspect of the information system. Can you afford to be last on the routing list for the news you need? Well now's the time to order your own subscription to COMPUTERWORLD. That way you'll stay abreast of all the latest news, products, people, developments, trends and issues — things professionals like you need to know to get ahead. And stay there.

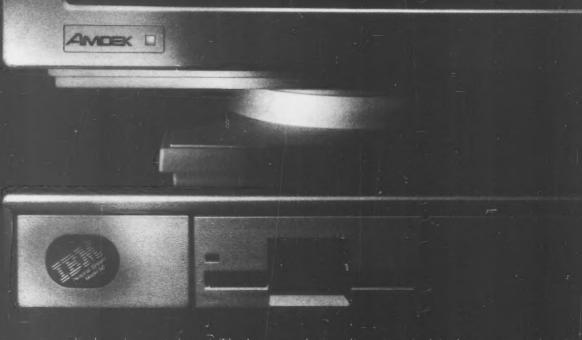

Don't delay, order now and get 51 information packed issues. You'll also get our special Spotlight section . . . featuring detailed head-to-head comparisons of the industry's latest products . . . and Integration sections . . . focusing on the linking of information technology and business strategy.

If you're thinking of putting an IBM monitor on your PS/2, you're not seeing the big picture.

When it comes to displays, bigger is better. That's one reason why the Amdek Monitor/432 monochrome VGA has a big edge over IBM's own standard PS/2 monitor.

But it's not the only reason. Because the 432 is, after all, from Amdek. A company with over 12 years experience in the computer monitor business, and the leading independent monochrome supplier."

The 432's 14" etched-surface, flat screen produces hardly

any glare or distortion. And far less eyestram than Big Blue's PS/2 monitor with its smaller, 12" curved screen.

What's more, IBM's smaller screen also carries, bigger price tag.

So, if you're choosing a monochrome monitor for a PS/2 or any AT compatible, remember the company that hasn't lost sight of the big picture. Amdek. For the dealer nearest you, call I-800-PC AMDEK.

MICRO BITS

Douglas Barney

Two thumbs down

A few years ago, mega-stars Warren Beatty and Dustin Hoffman teamed up on a film. It was expensively

produced and heavily advertised. It was called Ishtar.

The movie premiered amid record hoopla and high expectations. Fans waited in line, hoping for a synergistic performance from the two stars. Unfortunately, the movie stunk.

Now, a surprisingly similar scenario is playing itself out in the microcomputer business.

Like Ishtar, the publicity machines raved about what was to be the combination of the century. Instead of famous actors, robust and ready back-end database management systems with mainframe resumes were to be seamlessly mated to triedand-true personal computer front ends.

It was a user's and manager's dream come true. Without leaving the gentle confines of Dbase and Paradox, users would be able to query, manipulate and analyze data from a variety of back-end systems. These back ends had friendly, enticing names such as SQL Server and

DRI adds graphics upgrades

BY CHARLES VON SIMSON CW STAFF

MONTEREY, Calif. — Digital Research, Inc. (DRI), the feisty company whose CP/M operating system dominated the microcomputer business in the early 1980s, was reborn yet again recently with the introduction of a series of upgrades to its personal computer graphics product line.

New versions of Artline, the firm's illustration package, and Presentation Team, a business graphics package, will be available in the second quarter of 1990, DRI announced. The releases were accompanied by the unveiling of the firm's new logo.

"We are repositioning our graphics products as separate from our Gem systems software," said Dana Hooper, vicepresident and general manager of the company's graphics business unit. "Our marketing focus has changed."

However, while analysts felt that the two products are a solid

upgrade, senior management came under heavy criticism for not having a Microsoft Corp. Windows version of each product ready to go. Both packages are accessible under Windows, but neither will run as a native Windows application.

In the face of will do Windows charges that competitive products from companies such as Software Publishing Corp. were already Windowscompliant, DRI President Dick

Williams said that a Windows product was "in the works." 'When it is ready, we will an-

refusing to answer further questions on the subject.

Introduced in 1985, DRI's

Gem systems software was an attempt to provide a Macintosh-like graphical interface for the IBM PC. But in the same way that CP/M was swept away by Microsoft's DOS in 1981, Gem was obliterated by the Windows graphical interface.

Tough financial times followed. By

1987, when new Chief Executive Officer Williams joined the privately held company, revenue was down to \$20 million, from a high of \$56 million in 1985. Partly as a result of the strength of Artline and Presentation Team,

as well as several operating systems products, 1989 revenue was up around \$36 million, and the company said it has been profitable for about two years.

Windows wins

Bringing those applications out from under the Gem label is aimed at strengthening that trend. "We are no longer trying to push Gem as a system in competition with Windows," Hooper said. "We wanted to bring out our applications and sell them separately from Gem.'

With market research and Wall Street firms pegging growth in the graphics market at between 15% and 50% per year, there is no consensus on how fast DRI is likely to grow. Williams has estimated the company will grow to \$45 million in 1990.

Hooper said that while the company will continue to develop Gem, it will ultimately bring its applications out in a number of environments, including Windows and the Macintosh.

Outbound's light laptop acts as two Macs in one

BY RICHARD PASTORE

If Apple Computer, Inc.'s 16pound Macintosh Portable has you fearing a hernia, the new nine-pound Outbound Macintosh Laptop from Outbound Systems, Inc. may be more your cup of tea.

Chris Veal, a partner at the accounting firm Ernst & Young in San Jose, Calif., evaluated both the Mac Portable and the Outbound. He passed on the Apple product mainly because "it's big and quite expensive."

The Outbound machine, on the other hand, is "light and compact. It's a hell of an idea,' said Veal, who has been beta testing a unit since December.

The laptop, which began shipping earlier this month, operates in two modes. As a stand-alone. it is a totable Macintosh Plus and SE compatible; when "docked," or cabled, to a host Mac on the desktop, it serves as an upgrade

to the machine.

Williams

By docking the laptop to a Plus or SE, users can give these machines "a midlife kicker," said Douglas Swartz, chief executive officer at the Boulder. Colo.-based Outbound Systems.

The host Mac shares the laptop's storage and drives, and it utilizes the laptop screen as a contiguous addition. If the user drags the cursor off the side of the Mac screen, it seamlessly reappears on the

The COBOL Programmer Workstation and Its Impact on Productivity The Micro Focus Developers Seminar Schedule

The Programmer Workstation environment uses personal computers as intelligent, distributed workstations for developing, testing and maintaining host-based COBOL applications. At these Developers Seminars you will:

- See the positive impact the programmer workstation can have on programmer productivity
- See an in depth technical demonstration of the Micro Focus COBOL/2 Workbench facilities
- Watch CICS and IMS code offloaded from the host, running under the integrated Workbench testing environment
- Evaluate the workstation's potential in your organization
- Learn about latest product developments and future trends

Bar coding PCs ease case load

ONSITE

BY SALLY CUSACK

JEFFERSON CITY, Mo. — While computer-related crime is rising, computer technology is also finding its way into the courthouse to reduce paper shuffling and streamline documentation requirements.

Carolyn Steidley, director of data processing for the State of Missouri circuit courts, said an automated data collection system is making case-by-case recording a bit easier.

"We have a pilot project that is currently up and running in five different courthouses," she said. "We're using it to document and update civil cases, and it will be expanded to include criminal data later this month."

Errors in transposition

According to Steidley, the 250 trial courts throughout the state have been collecting data manually for a number of years. "We did some tracking," she said, "and it turned up that 90% of our errors were created when numbers were transposed on case files and reports."

In a system that processes close to 200,000 cases per year, unraveling those errors can be a mighty tedious proposition. The five Missouri courts are currently using portable data terminals from Panasonic Communications

Steidley implemented bar code labeling

and Systems Co. in Secaucus, N.J. First installed in 1989, the personal computer-based barcode scanning system is reportedly saving time and reducing errors.

To revamp the manual case records system, the State Courts Administrator's office issued bar-code labels for all existing case file folders. Sequentially numbered labels were then is

sued for anticipated case folders and sent to the designated courthouse. Courthouse workers are also sent a bar-code menu chart for updating and classifying scanned entries.

"When a case is filed, it is immediately given a bar-code label, and the information is entered into an on-site, Zenith 286-based machine," Steidley said. "When there is any activity on the case, the clerk simply scans the menu card for the appropriate bar-coded information, such as type of resolution, action, continuance or what have you, and it is automatically updated on the PC."

From the PC, the information can be reviewed or printed, and the data is then sent on a disk to the Office of the State Courts Administrator here. There it is loaded onto a Unisys Corp. A3K mainframe running under DMS.

Variety is the spice of life

In addition to generating statistical reports on the state's civil and criminal cases, the Unisys machine is responsible for payroll processing and accounting functions, as well as an attorney identification system.

The Courts Administrator's office develops all software in-

ternally. In addition to running the software for the bar-coding system, the Zenith Data Systems PCs also run an application that is used for tracking child support payments. The software is distributed free of charge to each of the participating district courts.

While all court employees are paid by the state, all operating expenses are the responsibility of the individual counties, according to Steidley. Hardware needs will vary from county to county, she said, and the Panasonic scanners are priced at about \$900 each.

Even with concerns about the dollar commitment, there are three courts already on the waiting list, and Steidley said she expects that about 20 courts will be participating in the bar-code program within the next few years.

DG jumps on bandwagon with 386SX-based portable

The hottest selling microprocessor from Intel Corp. — the 80386SX — is increasingly turning up in portables these days. Last week, Data General Corp. became the latest vendor to roll out an entry with its Walkabout/SX.

DG chose to distinguish its 16-pound luggable by underpricing its closest competitors. At \$4,995, the Walkabout is \$1,000 less than Toshiba America Information Systems, Inc.'s T3100SX and Zenith Data System's Supersport SX.

The 16-MHz machine features a backlit, black-on-white LCD. The screen also provides IBM Video Graphics Array resolution and offers 32 levels of gray scale.

The unit ships with a 1.44M-byte, 3½-in. floppy disk drive and a 40M-byte hard disk drive. Internal memory is expandable from 1M byte to 8M bytes. DOS 4.01, Basic and an expanded memory manager are also included.

DG rates the Walkabout's internal battery life at three to four hours. The machine features a user-definable sleep mode to prolong battery life. An optional internal modem is available for \$395.

RICHARD PASTORE

Turbotax makes electronic filing a viable option

(Editor's note: We know power users, and Pete Bartolik is no power user. But with tax preparation software packages stressing ease of use, we figured someone who detests manuals and disdains tutorials was probably appropriate for this review.)

BY PETER BARTOLIK

I wanted to send my federal tax return in via modem, I really did. When Chipsoft, Inc. offered the opportunity to utilize its electronic filing option, I readily accepted.

So after preparing the 1989 federal 1040 and related schedules using Chipsoft's Turbotax Personal 1040 (\$75) on an AT clone, this would-be reviewer put off mailing in the usual paper forms in hopes of doing it all electronically. Chipsoft really tried, but after waiting two weeks for the Chiplink form verification and communication software (\$12.50) to clear final testing, the two days I spent trying to log into a computer operated by Chipsoft's associate, Nelco, Inc., proved too much - especially with visions of that green refund check dancing in my head.

Not ready to give up on technology yet, however, and hopeful of the Internal Revenue Service's promise of a refund within three weeks, this eager taxpayer used Chiplink to transfer the electronic return to disk and mail it in with a credit-card authorization fee of \$15 to Nelco, figuring the mailman was not likely to be confronted with an "unable to detect Nelcom prompt" response. Nelco, a leading tax forms manufacturer, is an independent agent authorized by the IRS to transmit directly into IRS computers.

Despite the frustrations — you still have to mail in a paper electronic filing authorization form along with a W-2 — here is one taxpayer who is convinced that electronic tax return preparation is the only way to go. Using Turbotax for the first time may not have saved me much time overall, given the experimental nature of the effort and my feeble attempts to put the software through its paces, but it certainly cut out a few tedious hours hovering over a calculator.

Turbotax did everything I expected of it and more. From the introductory questionnaire that prompts the user for information needed to identify relevant tax forms to the what-if screen that enables running out different filing scenarios to determine if there is a way to generate a larger refund, the program provides confirmation that using tax preparation software is not only more efficient but also much more enjoyable than doing it on paper.

What it also did was remove a lot of the aggravation of sorting through federal forms and booklets. A screen available at the touch of the F6 key produces a list of some 32 forms and schedules and 22 worksheets — highlighting those needed for the re-

In the transmission phase, the file undergoes an error-checking process to ensure that the IRS will accept the electronic file. An error message kept directing me back to line 6c(4) of the 1040, where I had entered "daughter," and informing me, "Alpha-

Turbotax makes filing taxes more enjoyable

turn in progress. Calculations flow smoothly from worksheet to schedules to the 1040 form.

Chiplink, the communication and verification program, was easily loaded; easy-to-understand pull-down menus led me through the process of reading the tax return file from Turbotax, filling in an electronic W-2 file and building a transmission

numeric fields invalid."

Several attempts to rewrite the entry and ensure that justification was correct kept prompting the same message. Finally, an IRS booklet provided a hint: It referred to various relatives but never mentioned son or daughter, only child. "Son" had passed the alphanumeric test but not his sister, even though last year's written return used the same

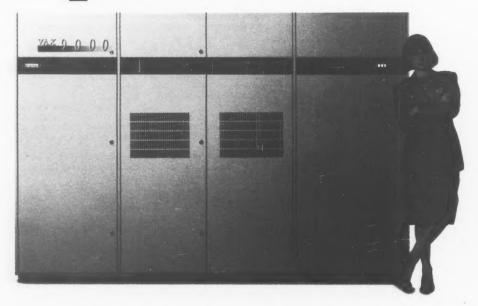

designations. Nevertheless, changing both to child passed the error-checking process.

The most identifiable feature distinguishing Turbotax from other tax packages I have read about is that the company also offers 41 packages for state tax returns. Although it easily converted the federal file into the state return format required by Massachusetts, I am not sure it is worth the extra expense (\$40), as many states require transfer of federal entries to state forms - especially if you can't align preprinted forms in your printer before running out of them.

However, the federal version certainly lives up to Chipsoft's claims. Once the software is loaded, there is little need to refer to the manual — definitely a major plus in my ratings — until you are ready to send it off in printed, disk or electronic format.

Anyone familiar with tax returns and personal computers should be able to utilize this program right out of the box. IRS instructions (except, I found, the business codes needed for Schedule C) are available at the touch of a function key. That may not be as attractive as the "expert" help available to users of Andrew Tobias' Tax Cut, but it was more than enough in this instance; additionally, Turbotax includes a paperback copy of The Price Waterhouse Personal Tax Advisor.

For total data protection, pick a VAX.

Whether it's on the largest VAX® system or the smallest, your data is safe. Because all across the line, VAX systems share a unique strength. It's their ability to provide the same high level of data protection and dependability. A level of dependability that other vendors offer only on a mainframe.

That's because VAX systems have something else in common. They all run the VMS® operating system which is one of the best engineered and most dependable operating systems ever designed.

VMS. So much more to depend on.

Because your data and information are the lifeblood of your company, you can never do enough to protect them. With that in mind, VAX/VMS systems and servers offer an unequalled number of distinctive protection features. Three, in particular, stand out.

The first is Digital's unique clustering capability. VAXcluster™ systems offer exceptionally high data availability and uptime, plus efficient resource sharing and expansion capabilities. You can quickly and easily combine

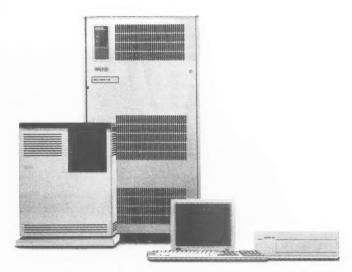

dozens of VAX systems into one powerful system. No single point of failure can bring the VAXcluster system down.

Then there's volume shadowing. This allows the system to simultaneously read and write data to two disk volumes instead of one. If one disk drive ever fails, the system automatically uses the other. Thus, information is always available and a major cause of downtime and lost data is eliminated.

The third is file journaling for safeguarding information whenever you enter it on the system. All transactions

© Digital Equipment Corporation 1990. The Digital logo, Digital has it now and VAXcluster are trademarks and VAX and VAS are registered trademarks of Digital Equipment Corporation.

Any VAX.

are recorded in a temporary file. If the system is interrupted, you can use the journal file to update your database to its correct state.

And that's just the beginning. In fact, no aspect has been overlooked. VAX computers with VMS offer a wide range of reliability and security features that protect against memory errors, I/O errors and brownouts, as well as unauthorized or inadvertent tampering with the system.

Total protection. Across the total line.

VMS. Dependability you can count on tomorrow.

For over a decade, businesses have trusted VAX systems running VMS for their critical applications. Today, with Network Application Support (NAS), applications running on your multivendor PCs, workstations and computer systems can also take advantage of the total data protection VMS offers.

And, in the future, as more and greater dependability features are added, you'll be able to rely on VAX systems with even greater confidence. All of which makes VAX and VMS the safe, smart choice for the long run.

Computers can do lots of sophisticated things. But there's one simple thing we believe is more important than any other.

You have to be able to count on them.

For more information on Digital's VAX systems, call 1-800-842-5273 ext. 11H.

has it now.

Study reveals users' priorities

Although workstation prices have declined, users are still cost-conscious

BY SALLY CUSACK

The workstation market is still price-sensitive despite significant price declines over the last several years, according to industry research.

A study by Strategic Focus, a Milpitas, Calif.-based research firm, showed that although users list improved processing power, graphics performance and networking capabilities as valid reasons for changing workstation vendors, most give initial price as the primary reason for making a switch. Software pormaking a switch. Software pormaking a switch.

tability ranked second on the list of reasons to switch vendors.

Based on responses from more than 8,000 workstation users in financial application, desktop publishing and computer-aided software engineering, design and manufacturing environments, the report revealed the following:

• Users awarded the blue ribbon in the pricing arena to Sun Microsystems, Inc.'s family of workstations, which also received the second-highest rating for computation performance.

 Hewlett-Packard Co.'s Apollo division collected highest honors in computation performance and ranked second to Sun in purchase price.

• In graphics performance, HP garnered the highest rating, followed by Sun.

 Apple Computer, Inc. was the clear winner in the overall easeof-use category.

of-use category.

Of respondents involved in software development, more than half said they are using X Window System on their work-stations. In addition, more than three-fourths of the respondents expect to use X Window as part of their computing platform over the next two years.

Unify learns to speak Open Look's language

BY CHARLES VON SIMSON CW STAFF

SACRAMENTO, Calif. — First in a market segment that is long on visibility but short on real impact, Unify Corp. last week announced the availability of its fourth-generation application development language for AT&T and Sun Microsystems, Inc.'s Open Look graphical user interface.

"Open Look is being shipped with Sun workstations, but who knows if anyone is really using it?" said Paul Cubbage, a Unix analyst at Dataquest, Inc., a research firm based in San Jose,

first with this interface, but I do

"The [graphical user interface] area is being pushed by the vendors. It may help Unify to be

not think the market has yet spo-

The new capabilities will allow developers using Accel SQL, Unify's 4GL tool kit, to port a number of Unix database systems — including those from rivals such as Oracle Systems Corp. and Informix Software, Inc. — to the Open Look interface with little or no change to the underlying code.

Follow the leader

While Informix has announced that it, too, will unbundle its development tools, and Oracle and Ingres Corp. are likely to follow, Unify claims to be the only supplier of such systems at this time. Oracle, Ingres and other

database management system vendors currently make their tools available with the purchase of the entire database system.

After losing its hold in the Unix database area, Unify has remained competitive by making the Accel SQL product available for all competitive databases. Accel SQL for Oracle, Ingres and Informix DBMSs have already shipped. In addition, a Sybase, Inc. version is scheduled to ship by the second quarter of 1990.

In the limelight

However, the attention being generated by graphical environments makes this area important to any independent company seeking to gain attention for its products.

"With the workstation market booming, we will certainly see increasing and able competition," said Ann Shukla, marketing director at Unify. "We feel that because we work independently of any database or interface, we are well-positioned to stay competitive with much larger companies."

Cubbage agreed with Shukla's observation, to a certain de-

"On the procurement side, if you look at Open Look, you might now be more likely to look at Accel and, ultimately, the Unity database, which I feel technologically is better than Oracle," he said.

"It is difficult to judge how many more people will look."

Outbound

FROM PAGE 53

adjacent side of the laptop display.

The additional screen acre-

The additional screen acreage allows users to have two documents up at once, work on them simultaneously and swap text or images between them using the Mac interface's Copy commands.

Outbound claimed the docked laptop will boost the host Mac's performance by a factor of two to three

When the connecting cable is unplugged, the laptop begins living up to its name. As a portable stand-alone, it retains the Mac interface and ability to run Plus and SE applications.

While the Macintosh Portable has an integrated trackball, the Outbound machine has opted for

its own answer to the mouse dilemma — an integrated sliding and rolling bar called an Isopoint.

"It takes some getting used to," Veal said of the Isopoint. "It's clearly not something you would want to use for CAD/ CAM."

Not tied down

Veal said he uses his machine for on-site audits. Prior to obtaining a portable, he would carry a hard disk into the field and hope to find an available Macintosh to plug into.

With the Outbound system,
"I'm not shackled to the availability of a Mac outside my office," he said.

Veal noted that several Ernst

Veal noted that several Ernst & Young staffers are interested in the unit, and the firm may consider it for purchase as standard portable equipment.

to Outbound chose to implement backlit, black-on-white cem, LCD technology, which, Swartz ail- admitted, cannot compare with the speed and readability of Apple's portable. The display's distant mensions, however, are larger ted

No docking

This is not the first portable Mac compatible to hit the streets. Dynamac Computer Products, Inc. in Golden, Colo., and Colby Systems Corp. in Fresno, Calif., both offer full-function units weighing in at more than 13 pounds. However, neither offers the ability to dock, according to Swartz.

The unit ships with either a 1.4M-byte, 3½-in. floppy disk drive or a 40M-byte hard drive. An optional external floppy drive will be available in June, the firm said.

The system can port to Appletalk networks and Apple printers. It uses an off-the-shelf, camcorder-style battery that provides up to three hours of power.

To use the Outbound system, the user must first have a dealer install an adapter board and transfer read-only memory chips from the host Mac to the laptop. This renders the host Mac unusable unless the laptop unit is connected to it.

This procedure is included in the Outbound system's price of \$2,999 for the floppy disk model and \$3,999 for the hard disk version.

Inc. in Golden, Colo., and Coloy Systems Corp. in Fresno, Calif., both offer full-function units weighing in at more than 13

There are two kinds of innovations in the computer business. The ones you just talk about. And the ones you actually use.

Introducing 1

Apple was the first to combine the power of computers with the power of burnanity. The 53 immountions in the new Macintois IIIs are designed to make that combination more powerful than over.

Every week, in these very pages, you read dramatic announcements from one personal computer company or another touting the most amazing innovations.

It all sounds very impressive.

Until you sit down at a keyboard and try to convert all that hype into practical benefits you can actually use.

This is what the new Macintosh IIfx personal computer is all about.

Apple's latest version of the UNIX operating system for Macinstoth, A/UX 2.0, lets you run UNIX, UNIX X Window System and off-the-shelf Macinstoth personal productivity programs at the same time on a Macinstoth [16], Li, UniX (circ SE/30.32 innovations for Apple, bundreds more choices for you.

The IIfx is, by any measure, one of the most powerful personal computers ever invented. Incorporating 53 major innovations, far too many to list here. But if you know something about personal computers, a few merit special mention:

It is the first personal computer to offer a Motorola 68030 microprocessor running at 40 megahertz. In information processing terms, this is akin to a red Ferrari screaming down the autobahn with *Ride of the Valkyries* cranked all the way up on the stereo.

It is also the first personal computer to have two additional processors — with the power of two additional personal computers — to manage the flow of information inside. So that that screaming 68030 chip isn't slowed down by the more mundane tasks of computer housekeeping. And so that you aren't slowed down. Ever.

It comes standard with 4 megabytes of memory and up to 160 megabytes of storage

capacity. Enough to run a healthy-size enterprise all by itself.

And it has six NuBus' slots that will let you expand its awesome capabilities even more.

A pair of new video coards turns 18 new ideas from Apple labs into 16,776,960 more colors you can actually see But only on a Macintent the IIfx truly powerful

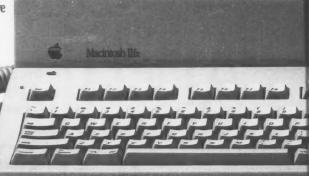

is that you can apply every one of its 53 innovations to solving the problems you have today. Even if you don't know a microprocessor from a food processor.

Because it is, above all else, a Macintosh.

It runs thousands of Macintosh programs that all work in the same consistent, intuitive way. So you don't have to wait years for someone to write software for it. Or waste months trying to figure out how it works.

It runs the Macintosh programs you already own,

The new Macintosh IIfx. Mea

03 of the latter.

too. So you can move up to its extraordinary performance level without spending thousands more for a whole new software library.

Yet the IIfx is also a powerful value. Because it costs less than personal computers that can only promise a future that Macintosh delivered years ago.

Of course, the beauty of owning any Macintosh is how easily you can take advantage of the latest Apple ideas.

You can appreciate the new Apple 24-bit color card, for instance, without knowing any of the details of its 5 innovations. Just pop it into any modular Macintosh and look at the breathtaking true color on the screen. It gives you the ability, in any program, to work
with as many as 16.8 million with as many as 16.8 million

colors (roughly 16,776,960 more than you'll see on

any other personal computer). Apple's new graphics accelerator card features a total of 13 innovations. But one glance at a

> Macintosh screen tells you all you need to know. It can translate half-a-million spreadsheet cells into presentation graphics as fast as a senior VP can ask for them. And bring lightning speed and true color to any application, even the most complex CAD, color publishing or animation jobs.

Continual improvements in Macintosh system software (the software that manages a computer's resources behind the scenes, no matter what program you're working on) are another way we add new capabilities to the computers you already own.

Case in point: Apple's latest version of the UNIX° operating system for Macintosh—A/UX° 20. It not only makes the notoriously complex UNIX easier to use. It's also the only version of UNIX that lets you run UNIX programs, UNIX X Window System programs and off-the-shelf Macintosh

computer is by the performance of the people who use it. But just for the record, the Hfx blew the windows of the bottest 486 PC in overall performance tests?

personal productivity software at the same time. For Apple, it represents 32 major improvements. For people who work in a UNIX environment, it means hundreds of new choices.

Yet A/UX 20 meets all the POSIX compliance standards demanded by government and large corporations.

Of course, the ultimate test of any innovation comes when you actually get your hands on it. Something your authorized Apple reseller will gladly arrange.

Then you'll know why Macintosh has the power to change the way you think about

The power you buy a computer for in the first place. The power to be your best.

sure its power by your results.

The power to be your best, no matter what you do best.

From the most affordable Macintosh Plus to the new Macintosh Ilfs, Macintosh plus sy the new Macintosh Ilfs, Macintosh gives you more power to do more things more easily than any other personal computer system in the world. The only question is, bow much power do you want?

What a wonderful time to be human. First, they tear down the Berlin Wall.

Then, Macintosh® becomes one of the most powerful personal computer systems in the world.

Humanity is in vogue. *Glasnost* is in the papers. And the computer for the rest of us has become the computer for all of us.

Scientists, engineers, teachers and students. CFOs, CEOs and CPAs.

Anywhere you find people who prefer actually getting things done instead of figuring out rigid, intimidating computers.

Why, even other personal computer companies are starting to see things our way.

But just as you can't expect the KGB to start picking up Nobel Peace Prizes, you can't expect any other computer to work like a Macintosh.

Only a Macintosh lets you learn the basics of thousands of different programs simply by learning one. So you spend more time actually using your computer. And less time figuring it out.

Only a Macintosh offers a whole family of

Apple LaserWriter* II Printers

Apple Hard Disk Drives

Apple CD SC** Drive

With dozens of Macintosh "plug & play" peripherals, setting up a Macintosh system is as easy as using one, fust plug them in. Turn them on. And get to work.

computers that all run the same software with the same point-and-click simplicity. So you can buy any Macintosh today, and you won't have to buy new software if you move up to a more powerful Macintosh tomorrow. Only a Macintosh gives you so much power to do so many things so easily.

Of course, just as different economic systems can work together to the benefit of both, so too can Macintosh work with the computer systems you have now: IBM mainframes, Digital VAX computers, token-ring networks, other personal computers, you name it.

And with any Macintosh equipped with an Apple® SuperDrive® disk drive, you can even move information between a Macintosh and an MS-DOS, OS/2 or Apple II computer on a standard 3½-inch floppy disk.

Of course, the best way to understand the power of Macintosh is to sit down and use one.

Then you'll know why Macintosh has the power to change the way you think about computers.

The power everyone in the world can appreciate. The power to be your best.

The power to be your best."

Barney

CONTINUED FROM PAGE 53

It seemed simple enough. A single language that consisted of only 12 commands would access and manipulate data, which was stored in simple rows and columns. It was called SQL, and the back ends that mattered already supported it. Like Ishtar, the PC publicity machines had us all waiting for a truly synergistic performance.

For the most part, we are still waiting. Sure, Ashton-Tate shipped a version of Dbase with SQL support. Unfortunately, it doesn't act as a client to anything. That's the stinky part.

Most of the problems have been with the PC guys. They are clearly good at marketing; they can make announcements, submit white papers on technology and convince customers that all this great stuff is worth planning for.

With typical PC arrogance, these vendors underestimated the job. They just can't seem to write the code to make it all work.

PC buyers and those who follow the business are fed up. Everything of significance that has been promised is now late.

Workstation aids nursing

BY JAMES DALY

PALM SPRINGS, Calif. — Although the nursing shortage continues unabated, a newly-released workstation that can be installed only steps from a patient's hospital bed and be used to streamline mundane paperwork chores may be just what the doctor ordered, for now.

The IBM 7690 Clinical Workstation, which IBM and Spectrum Healthcare Solutions introduced earlier this month, can be installed in a hospital room for quick access. Through the use of Spectrum's Point of Care Clinical Series software, health care providers can touch the workstation's screen to retrieve or record information such as vital signs, medication records and care plans. The intended result: a higher quality of health care.

With more than a million hospital beds throughout the country, the medical automation market is an important ingredient in IBM's prescription for expansion, an IBM spokesman said.

Two-point dictation

As part of that thrust, the company also introduced the Voice Management Facility/2, through which a specialist can simultaneously dictate a patient data report to a referring physician and the transcription department of the hospital.

The Clinical Workstation is priced at \$4,395 and is available now. The Point of Care Clinical Series will be available in the first quarter of 1991. It will be licensed to a nursing-station file server at a base cost

of \$13,500.

Prices for the Voice Management Facility/2, which was jointly developed by IBM and GE Medical Systems, will range from \$50,000 to \$300,000 when it becomes available in May.

Lotus/DBMS — whatever that is — is late. Dbase IV that works with any SQL back end is later than late. Microsoft's oft-reported Omega graphical database project isn't even the source of rumor anymore. And IBM's Officevision, the most ambitious of all client/server announcements? Haven't even seen a good demo yet (a good demo is when you get to use the keyboard).

There are many more products that are late. Fortunately, their lack of overall importance allows us to skip them. Buyers are likely to do the same.

Maybe it is just as well. Once these products do arrive, information systems executives and their database administrators will discover the flaws. Like a Yugo, these babies are bound to shudder

ITH TYPICAL PC arrogance, these vendors underestimated the job. They just can't seem to write the code to make it all work. PC buyers and those that follow the business are fed up. Everything of significance that has been promised is now late.

at speed

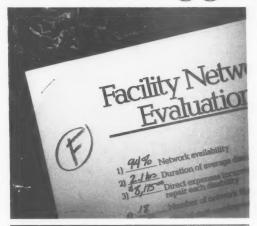

Client/server-crazed computer vendors are trying to cram together disparate entities. And like the critics that trashed *Ishtar*, it is about time someone stands up and says the idea stinks!

Client/server computing is a good idea. It is actually pretty radical; that is why it requires radical technology. It requires an entirely new approach in order to work properly. Retrofitting old technology is just plain dumb. Misleading users into thinking that it will work is even dumber.

I'm through waiting. I'd rather see Ishtar.

Barney is editor in chief of Amiga World.

In networking, we think 94% is a failing grade.

A recent study shows that in large corporations, the typical facility network only operates 94% of the time.

Which means, of course, that it's down 6% of the time.

6%. You wouldn't accept that from your phone company. Or your power company.

At Chipcom, we don't think you should accept it from your network, either.

Now, you don't have to. With Chipcom fault-tolerant networking, you have a network that never lets you down. A network that is:

Reliable—Not simple fault isolation. True fault tolerance for total network survivability.

Flexible—Repairs, additions, moves and changes can be done on the fly. Without taking the network down, and without user interruption.

Manageable—Not mere network monitoring. Real-time central control for interactive facility-wide network management.

Affordable—We can show you how a Chipcom fault-tolerant network will pay for itself many times over, and how you can add it incrementally to your present facility network.

For more information, call 1-800-228-9930.

There's a world of distance between our

Only AT&T Paradyne can provide extension of your mainframe's multiplexer channel to any where in the world, with virtually no loss in performance. With AT&T Paradyne's PIXNET-XL® channel extension products, you can access your mainframe across the ocean as fast as across the room. Which makes PIXNET-XL ideal for applications like host to host communications, data

center consolidation, disaster recovery and remote check processing.

PIXNET-XL is also easy on your budget. Besides eliminating the need for a remote CPU we can cut down your monthly line costs. PIXNET-XL doesn't require any increase in bandwidth no matter how far the distance. And since we have the flexibility to work with your existing hardware and software, getting

Data storage

Atlas Technology, Inc. has announced an add-on memory enhancement system that can be installed in an IBM Personal Computer AT, XT, 386 or any compatible equipped with 640K bytes of base memo-ry and a Color Graphics Adapter or monochrome graphics adapter.

The Atlas Technology Memory Enhancement System combines its 64K bytes of base memory with 640K-byte systems to create a total base memory of 720K bytes.

It is available with initialization software and documentation complete with all memory chips for \$149.95.

Atlas Technology 3900 Montclair Road Birmingham, Ala. 35213 205-871-9555

Pacific Micro has announced the PM 1.44, an external, 31/2-in., small computer systems interface (SCSI) floppy drive and the PM HDE, an external SCSI hard disk enclosure for the Next. Inc. Next comput-

PM 1.44 was designed for data transfers and software distribution for the Next computer, the vendor said. It can also be used for data transfers between Next and MS-DOS and Next and Apple Computer, Inc. Macintosh computers.

PM HDE can support either one or two Next hard disks as well as any combination of 330M- or 660M-byte hard drives up to 1.32G bytes.

Both drives have a retail price of \$995. Pacific Micro

Macintosh products

Radius, Inc. has introduced the Radius Pivot Display System, a graphics display system for Apple Computer, Inc. Macintosh computers that provides portrait (vertical) and landscape (horizontal) ori-

entations in one display.

One twist rotates the display 90 degrees, enabling users to switch from fullpage portrait orientation to full-page landscape orientation. During a reorientation, a position-sensing device signals a pixel

The Radius Pivot Display System rotates 90 degrees with one twist

rotation engine to rotate pixels at a 51.27-MHz rate, the vendor said.

The system is composed of Radiusware Pivot system software and a Radius Pivot Interface (\$695), which provides users of Macintosh SE/30 and Macintosh II computers with Pivot's dual-orientation capability. A Radius full-page display interface (\$595) configures the display for portrait-only operation, and a Radius Gray Shades Upgrade Kit (\$150) upgrades the Pivot display from four to 16 shades of gray, the vendor said. FPD interfaces are available for the Macintosh Plus, SE, SE/30 and II computers.

The Radius Pivot Display System has a suggested list price of \$1,690.

Radius 1710 Fortune Drive San Jose, Calif. 95131 408-434-1010

Systems

Vermont Microsystems, Inc. has announced a graphics subsystem for use with Interleaf, Inc.'s PC Viewstation.

The Page Manager Series 7 subsystem includes a 16-in. by 16-in. monitor with 768-pixel by 800-pixel resolution and a noninterlaced display with a horizontal scan rate of 76 KHz and a 70-Hz refresh rate. The product supports full-page what-you-see-is-what-you-get displays for PC Viewstation use.

The list price for the subsystem is \$1.795.

Vermont Microsystems 11 Tigan St. Winooski, Vt. 05404 800-354-0055

Reference Technology, Inc. has announced Reference Set, a compact disc/ read-only memory (CD-ROM) development data preparation and delivery system.

The system consists of Reference Bench, a data preparation workbench for capturing, converting and indexing data to be placed on CD-ROM discs; a CD-Simulator system for simulating and optimizing a CD-ROM application; and Reference Book retrieval software for accessing data distributed on CD-ROM discs, according to the vendor.

Pricing for Reference Bench data preparation tools begins at \$12,000, and the Reference Book retrieval software can be licensed for as low as \$15 per repli-

The CD-Simulator costs \$19,000. Reference Technology 5700 Flatiron Pkwy Boulder, Colo. 80301 303-449-4157

Development tools

Data Access Corp. has announced a software package that provides interoperability of applications and databases residing on dissimilar computers and operating systems.

The Dataflex Revision 3.0 includes client/server architecture and IBM's Systems Application Architecture-compliant object-oriented user interface management system enhancements. The product enables application developers to use an object-oriented interface to create or modify existing Dataflex applications, the vendor said.

Development licenses for Dataflex Revision 3.0 start at \$1,250 for a four-user Novell, Inc. or OS/2 network.

Training

Perfect Mentor, Inc. has announced a computer training system designed for law firms and businesses that teach per-

Perfect Mentor teaches PC skills for law firms and businesses

sonal computer skills or Wordperfect 5.0.

Using the Perfect Mentor system, trainers can choose from four main elements: an interactive computer-based training simulation program (Perfect Mentor Module I), nine manuals for classroom training or personal reference, more than 100 documents on disks for use with Wordperfect and a Personal Progress Tracker for designing custom training tracks, the vendor said.

A stand-alone version of Perfect Mentor Module I is being offered with a \$20 discount for \$637; a multiuser network version licensed for two users costs \$737. Elements of the training package can also be purchased separately.

Perfect Mentor 5433 S.W. Vacuna Portland, Ore. 97219 800-445-6300

A training technique for Wordperfect Corp.'s Wordperfect 5.1 is being offered by Microvideo Learning Systems.

The Wordperfect 5.1 Learning System features a videocassette, a data diskette and an in-depth manual. Topics covered include pull-down menus and the mouse, new formatting options, working with tables, new merge features, merge and macro commands and the equation editor. The video is 120 minutes long, and recommended training time is four hours, according to the vendor.

The product may be purchased separately for \$495 or with the Wordperfect 5.0 Learning System for \$1,195.

Microvideo Suite 600 91 Fifth Ave. New York, N.Y. 10003 212-255-3108

Peripherals

Extended Systems. Inc. has introduced a sharing device that resides in the optional I/O slot of a Hewlett-Packard Co. Laserjet III printer.

The ESI-2094A can accept data simultaneously from four connected devices and supports parallel transfer rates of more than 30K bit/sec. on all input ports, according to the vendor. The product also offers a 1M-byte standard memory buff-

The price for the ESI-2094A is \$845. **Extended Systems** 6062 Morris Hill Lane Boise, Idaho 83704 208-322-7163

KEDIT 4.0 XEDIT COMPATIBLE PC EDITOR

KEDIT

KEDIT™ is a text editor for DOS and OS/2 that supports most com-mands and features of XEDIT, IBM's editor for VM/CMS. But KEDIT goes beyond XEDIT compatibility with special PC-based features for a first-rate combination of mainframe power and PC flexibility.

- More than 100 XEDIT compatible commands and SET options, including the ALL command.
- XEDIT prefix commands, taraets, and fullscreen layout.
- Multiple files, multiple windows
- Built-in subset of the REXX macro language included.
- Interfaces to Personal REXX, our complete implementation of REXX.
- Enhanced block operations.
- And much, much more.

NETWORKING

SAA open and closed

Almost lost in the fanfare of its RISC System/ 6000 debut was the fact that IBM has made some sweeping com-

mitments in the communications area. IBM has opened up both of its AIX systems and the low end of its Systems Application Architecture (SAA) proprietary system base to connections with other vendors' systems via popular industry protocols.

The products that will be affected most by these changes are the "populist" IBM systems — OS/2 and OS/400. What IBM is promising here is to provide all of the internetworking options that have been denied at the low end. The effects of this will be to make IBM's SAA products for the office more open to non-SAA connections and, in particular, to facilitate Unix networking with IBM's low-end "commercial" lines.

In the area of file sharing, OS/400 and OS/2 both provide server capabilities for personal computer products attached through Token-Ring networks. The new announcement commits to extending that support in two ways.

First, the Applications

T1 supercomputer net reaches across Atlantic

BY MITCH BETTS

WASHINGTON, D.C. - The nation's data network for supercomputer-based research projects has implemented a T1 link between the U.S. and Europe and demonstrated a prototype T3 network that is expected to be operational at the speed of 45M bit/sec, later this year.

Such increases in transmission speed could make it easier for U.S. scientists to collaborate with overseas colleagues, according to the partnership that runs the National Science Foun-

dation Network (NSFnet).

The T1 trans-Atlantic link, provided by IBM and MCI Communications Corp., runs from the supercomputer facility at Cornell University in Ithaca, N.Y., through the TAT-8 undersea fiber-optic cable to Geneva, where it connects with a Europesupercomputer much like the NSFnet in the U.S.

Compared with the existing satellite links, which transmit at speeds of 56K to 64K bit/sec., the high-speed private T1 line will make scientific collaboration more effective because researchers can see the same

graphic images and text almost simultaneously, officials said.

IBM, MCI and Merit Comput-Network, which manages NSFnet from its base in Ann Arbor, Mich., demonstrated the T3 capability over MCI circuits during the National Net '90 conference in Washington, D.C., earlier this month [CW, March 12].

System 6000 used

IBM used several of its recently announced RISC System/6000 workstations, equipped with prototype network adapters and designed packetswitching software, to connect conference participants with the NSFnet operations center in Ann Arbor.

IBM also demonstrated the ability to connect two RS/6000s on a Fiber Distributed Data Interchange local-area network, operating at 100M bit/sec.

"With a T3 network, we can improve our scientific productivity in ways that are currently impossible," said Stephen S. Wolff, a division director at the NSF.

"New applications will enable scientists to steer large computations on remote supercomputers and visualize the progress of these simulations across the network in real time," added Mi-chael M. Connors, director of computing systems at IBM Research. "A national T3 data network would improve the access to large and expensive shared scientific resources like telescopes, nuclear particle accelerators, wind tunnels and supercomputers.

The U.S. portion of NSFnet is currently at T1 speed and is expected to be operating at T3 later this year.

LANs on the way to better, not bigger

Study shows emphasis on efficiency in current systems is on the rise

Information systems departments are ready to begin filling out and bridging their installed local-area networks rather than furiously building new ones, according to a recent report by the investment firm Salomon Brothers. Inc. in New York.

The report, written by analyst Michel Guite, charts a dramatic plateau in personal com-puter LAN and LAN component sales growth. Guite anticipates a radical flattening in most market categories and predicts sales declines in two segments - adapter cards and proprietary servers.

Guite examined market fig-

ures from 1987 through 1991 for 3Com Corp.; Novell, Inc.; Cabletron Systems, Inc.; Synoptics Communications. Inc.: Microcom, Inc.; and Vitalink Communications, Inc. He combined these totals with industrywide LAN numbers to spot trends in PC and system LAN markets.

More PC growth
Guite predicted a steady increase in the percentage of PCs and workstations being connected to PC LANs, up from 24% last year to 29% this year and 33% in

Report figures indicated that new purchases overall will fall. with the strongest sectors including bridges, routers and the nuts-and-bolts cable and cable components. At the same time, he said, sales growth in operating system software, propri-etary servers, LAN adapter cards and LAN components will level off or drop the soonest.

Leading the decline in sales growth, Guite predicted, will be proprietary servers and PC LAN adapter cards. Guite said proprietary server sales will increase only 4.5% to \$943 million this year and will drop 10.8% in 1991 to \$841 million.

However, the overall server market, which includes standards based PCs, workstations and minicomputers, will grow at a compound rate of 54.4% per year from 1987 to 1991, the re-

Brake time

The days of almost 50% annual growth are in the past for the PC local-area network market

Percent increase in PC LAN sales

Sales of adapter cards rose 61% from \$809 million to \$1.3 billion between 1987 and 1988. Guite said. Growth was halved last year to 29%. Guite projected growth slowing further to an an-

IBM begins to fill open systems gaps

BY ELISABETH HORWITT

RYE, N.Y. - Conceding that 'situations will exist where SAA systems and AIX systems need to be interconnected," IBM recently filled in some gaps in its strategy of supporting industry and de facto standards as a means of connecting its own systems and those of other vendors, and managing the result.

When IBM announced its RISC System/6000 family of systems last month, the firm also stated its intent to provide support for Systems Network Ar-chitecture LU6.2, Open Systems Interconnect (OSI) and Transmission Control Protocol/ Internet Protocol (TCP/IP) Piece by piece

IBM's interoperability strategy is gradually coming together

	AIX/ 6000	AIX/ PS/2	AIX/ 370	MVS	VM	OS/2 EE	OS/400
SNA LU6.2	AN	SOII	*	AV	AV	AV	AV
OSI	SOD	son	SOL	AN	AN	SAA	SAA
TCP/IP	AN	AV	AV	AV	AV	AN	AV
SNMP	AN	SON	SOD	SOY	SOF	AN	SOD
CMIS/CMIP	SOL	SOU	Son	AN	AN	SOU	SOF

SOD = Statement of direction (current or future version)
SAA = Statement of support previously introduced by SAA

* For the System/370 AIX environments, direction for selected future AIX version product offerings will be announced at a later date.

across all AIX systems, as well as for the Systems Application Architecture (SAA) environments VM, MVS, OS/2 and OS/400.

Among the key pieces that IBM added to its existing communications strategy included the following:

· Support of LU6.2 on the AIX/6000, with a direction statement to support other AIX systems. Until now, IBM had provided no AIX support for the peer-to-peer protocol, which forms the fulcrum of the vendor's networking strategy.

 Intent to provide OSI support for AIX, as well as for OS/2 Extended and OS/400 systems. Previously, IBM had announced OSI support only for MVS and VM systems.

A ground-breaking IBM announcement in the network management area was AIX/ 6000 support for the Simple Network Management Protocol (SNMP), a de facto network management standard typically used to manage TCP/IP networks. A prototype of this system is currently being used by the National Science Foundation to manage NSFnet, a high-speed backbone that connects re-search and academic institutions in the U.S. and, increasingly, abroad.

In addition, IBM announced SNMP support for OS/2 and made a statement of direction to support the network management protocol on other AIX systems, as well as on all SAA systems.

However, these are implementations of the SNMP 'agent," which turns a system into a management halfway point that passes data up to, and commands down from, a "super-manager," which in this case would be IBM's Netview.

In contrast, IBM's AIX/6000 implementation of SNMP includes both the agent and the monitor portion of the protocol,

Continued on page 68

CONTINUED FROM PAGE 67

System/400 will support the Sun Microsystems Network File System (NFS), the most popular Unix resource sharing environment, in server mode. This will enable any Unix system linked via the AS/400's Transmission Control Protocol/Internet Protocol (TCP/IP) Ethernet local-area network support to access AS/400 disks and printers.

Second, IBM will provide NFS client support to OS/2, allowing it to share files on Unix NFS servers. TCP/IP support has already been announced.

In standards-based communications, IBM has promised to provide Open Sys-tems Interconnect (OSI) protocol support on both the OS/2 and OS/400 environments. This would involve the same OSI "stack" implemented on MVS and VM and would provide low-end users with facilities for standards-based electronic mail, file transfer and even distributed application development.

IBM has also stated that it will provide support for the Unix-standard X Window System client/server graphical environment, offering AS/400 users client access to X Window applications and OS/2 users both client access and the ability to run X Window applications.

By implementing NFS and OSI on its lower end systems, IBM has cut them loose from the data center by allowing them to communicate directly with non-IBM systems. Formerly, such communication was possible only through an IBM host. This means users no longer have to make an irrevocable strategic choice between Unix and OS/2 or AS/400.

Unfortunately, there is a closed side as well. Not only has IBM left out some features and demonstrated that it is not yet ready for fully open networking across all systems, it also has not implemented NFS client software or X Window server software on the AS/400. AS/400 users cannot, under present commitments, hope to share files on a Unix server or run X Window applications. Either of these might open the AS/400 too much to Unix competition, even from IBM's own RS/6000.

But the biggest disappointment is in the area of network management. IBM has promised support for the critical OSI management standard, Common Management Information Protocol (CMIP), and TCP/IP's Simplified Network Management Protocol (SNMP) on all of its SAA and AIX systems.

The bad news is that OS/2 and OS/400 will only support the agent side of CMIP and SNMP. This means they will be manageable by host systems running those protocols but will not be able to act as the management focal point for other OSI- or SNMP-compatible systems. Netview will be, then as now, the recognized manager of IBM's networks.

The decision to close ranks around Netview contradicts IBM's other moves toward openness and shows that IBM does not fully understand users' network management needs. By preventing the AS/400 from becoming an OSI network management center, IBM is encouraging users to go to another vendor if they want to manage their networks on something less costly than an IBM mainframe.

Nolle is president of CIMI Corp., a communica tions consulting company based in Haddonfield, N.J.

CONTINUED FROM PAGE 67

which allows an AIX workstation to act as a network management system on its own. IBM has made a statement of direction to provide the system with a linkup to Netview so that it "will be able to forward SNMP traffic to Netview or act as a local manager," IBM TCP/IP product manager Gail Mever said.

IBM also made a statement of direction to support the Common Management Information Protocol and Common Management Information Service across all of its AIX and SAA systems. Right now, only IBM MVS and VM hosts support the OSI protocols.

Again, however, IBM is implementing only the agent side of the management standard, turning its various systems into entry points which, along with Netview/ PC. act as liaisons between various netthe AIX system as a stand-alone network manager because it realized that some "just plain Unix" sites operate "where IBM backbone hosts are not available," IBM spokesman Michael McClennan said.

GROUND-BREAKING IBM announcement in the network management area was AIX/6000 support for the Simple Network Management Protocol.

works and Netview. "IBM's strategy for handling multivendor network manage-ment is Netview," providing the network manager with "one tool to manage the network, whether it is OSI or TCP/IP," an IBM spokesman said. IBM has set up

Users may eventually see a standalone Common Management Information Protocol implementation on AIX, since IBM sees "the need to migrate from SNMP to an OSI Inetwork management workstation] in the future," Meyer said.

BMC Software's wa IMS education at th

To learn more about the depth of BMC's product line for IBM®'s DB2™ data base management system and IMS, attend BMC's new innovative 1990 education meetings. These one, or two-day meet-

- Provide you insight into industry thinking,
- Educate you on new technology,
- Inform you what other users are doing,
- Excite you over the possibilities for your operations, and

■ Tell you about the current BMC products, new versions and products under development. Each BMC meeting includes a continental breakfast at the start of the day and lunch at the noon break. And, all of these meetings are free. Decide today on the BMC meetings you want to attend and then return the attached coupon, or give BMC a toll-free call:

1-800-841-2031

ACC taking the Decnet route

BY JOANIE M. WEXLER

Advanced Computer Communications (ACC) plans to announce tomorrow that its bridges and routers now support Decnet Phase IV routing.

Decnet Phase IV is Digital Equipment Corp.'s proprietary seven-layer communications protocol stack, which DEC is transitioning to support Open Systems Interconnect (OSI) protocols at the bottom four layers. Decnet's routing protocol was recently chosen as the basis for the OSI routing standard.

ACC said last week that it is adding the

Decnet support to existing Internet Protocol routing through software enhancements to its \$7,500 ACS 4100 standard hardware and \$8,500 to \$20,500 ACS 4400 multiport platform. Both platforms can function as a bridge, router or a combined bridge/router.

All ACC bridging products have management features based on the open Simple Network Management Protocol for managing heterogeneous devices.

ACC said it is solely targeting valueadded resellers and systems integrators with its bridging products, because it sees a niche in providing that market with new opportunities to service its account base.

Tariff 12 ball keeps on rolling

BY ELISABETH HORWITT

AT&T's Tariff 12 juggernaut showed a fresh burst of speed last week, with three more major companies signing multiyear, multimillion-dollar contracts with the communications giant.

As part of its strategy to move away from a privately managed dedicated network, Atlantic Richfield Co. (Arco) signed a five-year contract under which AT&T will provide switched voice and data services as well as design and possibly operate a network management center for the petroleum products company.

Still under discussion is whether AT&T, Arco or both companies would operate the center, an AT&T spokeswoman said. However, AT&T would retain ultimate management responsibility for its own switched network facilities, she add-

Also last week, CSX Technology Group signed a three-year, \$30 million contract under which AT&T will provide voice and data connections among 500 sites at parent CSX Corp., an internation-

al transportation company.
General Dynamics Corp. signed a contract valued at more than \$18 million over a five-year period, including two one-year renewal options. Under the contract, AT&T will set up a network to provide integrated voice, data and video to the giant defense contractor's corporate headquarters in Clayton, Mo., and 300 other loca-

ticipated 20% (\$2 billion) this year before dropping 6% in 1991 to \$1.9 billion.

One of the more hearty market segments was what Guite called physical-layer PC LAN sales. Included under this heading are repeaters, concentrators and wiring assemblies. However, even here sales growth is expected to fall drastical-

Guite stated that sales grew 125% between 1987 and 1988 from \$223 million to \$502 million. The growth rate is expected to continue halving annually, reaching 17% next year, with sales totaling \$1.3 billion.

Guite predicted that operating system software sales growth rates will decline steadily from 58% in 1988 to an estimated 17% in 1991, when sales will reach \$1.4 billion. Much of the stability here can be attributed to increased connectivity to Unix-based systems, he explained.

PC LAN bridge and router sales growth should fall less sharply as well. The report indicates that growth will slow from 59% in 1988 to 21% in 1991, when sales are expected to reach \$500 million.

IMS Round Up

Participate in a two-day IMS ROUND UP to gain valuable information for enhancing your IMS opera-tions. BMC's products for IMS/DB, IMS/Fast Path and IMS/DC cover data base administration, utilities, network performance, online IMS, and DASD data compression.

An industry expert in IMS data base and data communications will give the keynote address at every ROUND UP and answer your questions about the technology, trends and future of IMS. Presentations by BMC's IMS products users are planned, as well as sessions covering new BMC IMS products, current products and new versions.

A study in systems transparency

UMass' Project Pilgrim sets sail in heterogeneous computing environment

BY JIM NASH

AMHERST, Mass. — Using a number of separate software technologies, systems managers at the University of Massachusetts are building transparency into the campus' highly heterogeneous computer community.

UMass plans to wrap universal time, remote procedure call (RPC), authentification and naming services into one coherent bundle and apply the package in an undertaking called Project Pilgrim. Only the university's Computer and Information Science Department and the College of Engineering will take part in the project. Between the two, there are 4,300 users.

Information systems managers intend to eliminate the need for users in heterogeneous environments to know every operating system's setup and commands in order to use those systems, said Art Gaylord, director of computing facilities for the university's Computer and Information Science Department. Simultaneously, managers will address the task of managing such a sprawling system.

UMass will use a \$6 million, three-year grant from Digital Equipment Corp. to fund the project. As part of the grant, DEC will supply equipment, personnel and expertise for Pilgrim.

In return, DEC will receive nonexclusive, nonroyalty rights to use any software born of Pilgrim, according to Kathleen Rubin, co-director of UMass' engineering computer services. Other vendors, such as Sun Microsystems, Inc., IBM and Texas Instruments, Inc. have expressed interest in the project, but none have enlisted to date.

Pilgrim will use much of what was learned through Project Athena, a joint connectivity project among MIT, IBM and DEC that was launched in the early 1980s. DEC collaborated with IBM and MIT throughout the 1980s to think through emerging connectivity problems. One of the chief products of Project Athena was connectivity software, including X Window System.

However, whereas Athena resulted in connectivity software for IBM and DEC equipment, Pilgrim seeks practical ways to connect minicomputers and workstations from vendors such as DEC, Sun and TI, as well as various brands of personal computers, UMass officials said.

There are other joint industry/university projects looking for connectivity answers, but Pilgrim stands out because of its

and every one of those 4,000 users in the absence of a project like this."

There is some degree of connectivity on campus now, most

There is some degree of connectivity on campus now, most of it through Ethernet running several protocols, including Decnet and Transmission Control

computer services. "We have to manage user accounts on each

UMass' Paul McOwen (left), Kathleen Rubin and Art Gaylord

emphasis on heterogeneity.

"We have 4,000 users [in the College of Engineering]," explained Dan Blanchard, co-director (with Rubin) of engineering Protocol/Internet Protocol, Gaylord said. "But users still have to know specifically what to do [to access and operate a different system] when they get there," Gaylord said. "We're trying to hide the differences between operating systems and hardware for the user."

For Blanchard, Pilgrim's goal is clear: "We want more of a traditional central-management approach to a distributed system. [UMass needs] a standard platform on which to develop educational courseware for instruction, student interaction and teachers' planning."

Gaylord said that RPC service is critical to workstation users, who would benefit from the increased speed and horsepower attained through RPC. RPC enables users to run a program on the fastest resource available at a given time without having to rewrite the program if the fastest resource runs on a different operating system.

The service also enables users to break massive programs into pieces, distributing them to a number of available workstations for faster processing.

Charles Wilson, DEC's senior program manager for Pilgrim, said, "Security is of the utmost priority" for Pilgrim. Authentification becomes more of a problem in distributed systems environments — for the system and the user. Not only does the system need to accurately identify authorized users, but users also increasingly need to know where their programs are going — knowledge that is not commonly available, Wilson said.

NEW PRODUCTS

Cabling

Bravo Communications, Inc. has introduced its Sure/Fire Port Protector series, designed to protect computer equipment from all forms of data-line transients.

The parallel port protectors are available in either 25- or 36pin configurations and include shielded connectors for additional protection and proper grounding.

Pricing ranges from \$59 to \$69, and all units come with a standard one-year warranty.

A shared very small aperture terminal (VSAT) network has been introduced by Racal-Milgo Skynetworks.

The service is based on the sharing of regional hubs in a geographic region of 50 to 100 miles in radius. In each region, Racal-Milgo Skynetworks forms a partnership with a company or organization that acts as a host for the hub.

The service includes installation, operation and maintenance of the hub and all associated VSATs, acquisition of satellite space segments and full, 24-hour network management.

Uniview, Integrated Telecom's net management tool

Network management

Integrated Telecom Corp. has announced Uniview, a network management tool for point-topoint or large network operations.

The system comprises an Intel Corp. 80386-based IBM Personal Computer 80386 that runs under OS/2 with 8M bytes of

random-access memory, a 1.2M-byte floppy disk drive, an 80M-byte hard disk drive, an integral processor card, an NEC Multisync four-dimensional color CRT and a dot-matrix printer.

With Uniview, network managers can provision, administer, maintain and control any node in a network by using a color graphics-based, mouse-driven interface, the vendor said.

The tool is slated to begin shipping in September. The price of the PC hardware is \$15,000; Uniview 1.0 application software is \$5,000. Delivery is sheduled to be 90 days after receipt of order.

Integrated Telecom 630 International Pkwy. Richardson, Texas 75081 214-234-3340

Network services

Western Union Corp. has introduced a service that provides customers with business news or information on user-selected topics via facsimile or electronic mail.

With the Executive Briefing Service, customers can obtain data on products, industries, companies or technical terms without the need for a host computer, the company said. For a single subscription, the service can monitor a range of informa-

tion sources, such as news wires, press releases, trade journals, newsletters, government reports and patent documents. The service can also provide English translations of foreign materials.

The service's price is a flat rate of \$595 per month.

Modems

Raycom Systems, Inc. has announced the 5080 I/O module, which is designed for use on its Fiberring 100 fiber-optic campus backbone system.

The product enables users to multiplex up to 896 IBM 5080 workstations over a 100M bit/sec. fiber-optic ring. When used with an IBM 5088 Model 2 Graphics Channel Controller, a pair of 5080 I/O modules can accommodate two controllers, 64 IBM 5085 Graphics Processors and 5080 workstations, according to the vendor. The modules are transparent to 5080 protocols and operate at the local data rate of 1M or 2M bit/sec., with automatic speed selection.

When the module is used in the FR100 fiber-optic multiplexer, the transmission distance between the controller and the workstations extends beyond that of copper cable.

Single-unit quantities of the 5080 I/O module cost \$1,850; delivery is 60 days after receipt of order.

Raycom Systems 6395 Gunpark Drive Boulder, Colo. 80301 303-530-1620

Universal Data Systems has combined a 19.2K bit/sec. leased-line modem with a two-channel time division multiplexer (TDM). The UDS 1922's integral TDM allows two data terminals to communicate over a single leased telephone line.

The UDS 1922 is designed for synchronous data transmission and reportedly communicates in full-duplex mode over four-wire lines at 19.2K, 16.8K, 14.4K and 12K bit/sec. A selectable V.33 mode allows the modem to connect to other vendors modems at 14.4K bit/sec.

The modem automatically adjusts its data rate depending on telephone line conditions. It features trellis-coded modulation, automatic adaptive line equalization and line graphic adjustment.

tion and line-quality adjustment.
The UDS 1922 is priced at \$2,995.

Mission: To control IS costs in an industry downturn while continuing to deploy technology to strategic advantage

cial sense," adds Gerry Eli, director of global IS. "He fits right in with upper management.

Peterson cites three success factors for aspiring IS executives: a solid track record of performance, good communication skills and the ability to translate technology into business terms.

"The key is establishing credibility with management," he says. "The compliment I always get is that I make it sound so easy. You have to take the mystery out of it."

An only child born in Evanston, Ill., Peterson spent most of his youth in the Continued on page 80

The IS task ahead: Nobody

BY ALAN J. RYAN

Information systems managers say they will be feeling "high" to "excruci-ating" levels of pain as their companies transform the way they use information and ultimately do business in the next decade.

In a recent poll of 112 senior executives surveyed by Arthur D. Little, Inc. at its "Implementing the Information-Based Organization" conference (see story on page 77), two-thirds said the transformation process will be painful.

However, what was most interesting in the findings, according to Arthur D. Little senior consultant Laurence Chait, is how rapidly the companies said they will have to change.

For example, 96% of those polled said their companies were either traditionally based or semi-traditionally

- meaning the manage ment was hierarchical and structured. and strict rules were followed regarding access to information. Today, that number still stands at a hefty 94%.

By the year 2000, however, just 4% of the executives said their companies will still follow that management format. The other 96% said they believe their companies will be information-

Arthur D Little

based by 2000 - meaning that they will be flatter and more responsive and that the employees will be empowered to do whatever needs to be done to help the company.

'That is a major change in the way companies are structured, organized and do work," Chait said. Most of the executives said it is critical or inevitable that their companies become information-based, he added.

Of those polled, another 96% said

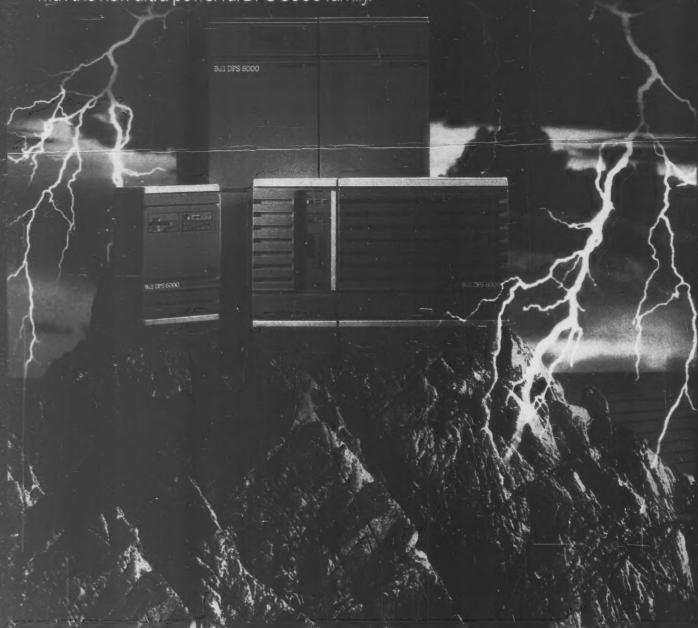

that once their organizations become information-based, their organizations will be better places to work. "Ulti-mately," Chait said, "the transformation will completely alter the way they do business.

Nearly 60% of the respondents said customer focus, and 46% said total quality management, were key driving forces that mandate the shift to the information-based organization.

Chait said it is important to realize that, while technology will be the enabler of the changes on the way in corporate America, changes in values and reward structures will also drive the move toward the information-based organization.

Approximately 90% of the companies represented in the poll had annual sales in excess of \$100 million, Chait said. Smaller companies tend to be more entrepreneurial, which tends to make them more information-based,

BOOK REVIEW

Reciprocity: A recipe for getting things done without animosity

INFLUENCE WITHOUT AUTHORITY

By Allan R. Cohen and David L. Bradford John Wiley & Sons, \$19.95

When I first looked at the title of Influence without Authority, I thought, "Oh no, a book about brownnosing." Well, not exactly. The book is a realistic and engaging look at how to get things done when you don't necessarily have the authority to just say "Do it." It makes its points by using two increasingly rare commodities: practicality and common sense.

Written by Allan Cohen and David Bradford, the co-authors of the bestseiler Managing for Excellence, the book is a response to the needs of today's firms. In these days of intense competition and lightning-fast technological change, companies have to be fast on their feet just to introduce a product before it is outdated.

In order to respond to today's business environment, the authors say, decisions and cooperation must increase on a horizontal level. It doesn't make sense anymore to keep the power concentrated with a few top people. The current flattened organizational structure of many companies forces employees nowadays to take the initiative in getting things done. This creates a greater need for clear communication and the ability to creatively influence people.

This method is hardly ground-breaking. Digital Equipment Corp., for example, has had a similar structure in place for years. The value of Influence without Authority lies in its ability to take you through the process in a step-by-step fashion and show you the ropes. The authors' approach takes commonsense principles such as "walk a mile in my shoes" or the famous "do unto others..." and translates them into a business guide to influence.

You scratch my back . . .

The authors base their approach on the theory that the exchange of favors between people is the base of most successful influence. Dealing with people involves the "law of reciprocity," or the general feeling that one good turn deserves another. For example, if your boss asks you to work several weekends in a row, you would expect some form of acknowledgment. This could take the form of anything from a heartfelt "thank you" to some extra time off, but the extra effort needs to somehow be paid off.

These forms of exchange are divided into three different categories: tangible goods, such as equipment; tangible services, such as faster response or public support; and sentiments, which would take the form of appreciation or praise. These can all be used for successful influencing, and they lie at the root of nearly exercitions that gets done in business.

everything that gets done in business.

Cohen and Bradford discuss many different "currencies of exchange" with which the would-be influencer can bargain and finding the one in which your potential ally trades is vital to your attempt at influencing. For example, if you need a

favor from a product manager whose first priority is the financial bottom line, he is not likely to be impressed or swayed with

figures about time savings. The request should be couched in terms of potential cost savings, if possible.

None of this stuff is earthshattering. A lot of it is good common sense. But that shouldn't alter the fact that getting to know the practical use and application of these ideas could make your work life both more pleasant and more effective. The authors

life both more pleasant and more effective. The authors outline possible exchange strategies, from influencing your boss to playing hardball as a last resort. They present sit-

uations in which influence strategies are attempted — not always successfully — and then analyze what happened.

There is a thin line between influencing and manipulation, and there are those who question the ethicality of these methods. The authors emphasize that getting things done through exaggeration and lies will result in short-term benefits only. Since acceptable currencies of exchange can range from getting a report done early to reinforcing somebody's pride

reinforcing somebody's pride in a job well done, it is important to keep the record honest. As the authors comment in their discussion of manipulation,

"To make exchanges work, you must build a track record of trust. The whole system breaks down when it becomes an endless hand of liars' poker."

Cohen and Bradford are meticulous about making their points clear — sometimes a bit too much so. A particular issue can be summarized as many as three times in one chapter, and if it crops up later on in the book they'll summarize it again, in case you forgot. Other than that small problem, Influence without Authority will find you nodding your head in agreement as they hit home with one practical piece of advice after another.

Is your computer company giving you the right equipment for the job? Bell Atlantic Computer Products has all the alternatives.

Internal data flow seen as crucial to info-based firms

BY JEAN S. BOZMAN

PALM SPRINGS, Calif. — The "information" in the information-based organization of the 1990s no longer translates into the word "data." While traditional information systems organizations are used to manipulating data, the challenge of adding value to it — making it into information that can be used competitively — eludes many.

Speakers at a recent Arthur D. Little, Inc. management conference concluded that the organization that runs on well-timed "information" does, indeed, have a competitive edge. However, most organizations still struggle with freeing themselves from hierarchical reporting structures that often filter or distort data as it travels through an organization.

"In the information-based organization, information is a two-way street," said management consultant Peter Drucker, who coined the term "information-based organization" in a now-famous 1988 Harvard Business Review article. "People will have to take responsibility for finding out what information they will need [to do their job] and for finding out what information they owe [to others in the organization]."

Speaking to the IS executives present, Drucker said: "You have a training job to do. You have created a small core of [information] specialists in your department, but you will have to train other people in your organization to become information-literate. That's because IS is one of the very few places [in a corporation] where you can see the whole business."

Mutual Benefit Life Insurance Co. in Newark, N.J., has been working just as hard on spreading information as it has worked on flattening its organization in recent years, according to Mutual Senior Vice-President Keith T. Glover. To reduce the number of individual clerks and agents involved in issuing a life insurance policy, the company made centralized databases widely available through IBM Personal System/2 interfaces.

"We were a classic monolith in 1984,"
Glover said. "But we were determined to
make our business more entrepreneurial
and transaction-oriented. We set up the
database to support one-stop shopping instead of passing the policy around to many
people who owned a piece of the data."

people who owned a piece of the data."
In the process, Mutual cut 75 positions in the field and 100 more at headquarters. Response to customer inquiries was reduced from several weeks of paper shuffling to either several days for a mailed inquiry or one phone call.

Communications is a key to the information-based organization, speakers agreed. Sunkist Growers, Inc., the California citrus fruit cooperative, found that its system of communicating pricing and inventory information among 60 packing houses was hampering its ability to sell to supermarkets nationwide. To combat the problem, the association of 6,000 growers is building a new data infrastructure, said Bud Flach, vice-president of finance and administration.

Even if they are widely available, the contents of a corporation's database have to be reshaped to yield a competitive edge. Roadway Package Systems, Inc. in Pittsburgh uses the river of information flowing through its 15 regional sorting centers to produce additional customer services, said Bram Johnson, the firm's vice-president of marketing. The basic data is presented in different ways to give customers and Roadway employees "views" of the business, Johnson said.

"We really believe we differentiate our product with information," Johnson said. "My trucks don't go any faster than my competitors' trucks do, but I can give my customer information on demand about where his package is."

is a registered trademark of Hewlett-Packard. Epson is a registered trademark of Seiko Epson Corp. © 1990 Epson America, Inc., 2780 Lomita Blvd., Torrance, CA 90505. (800) 922-8911.

Opting for the quality of a laser printer has just become decidedly easier. Introducing the EPL-6000 laser printer from Epson.

EPL-6000 Now \$1499 Coming from the company with the longest running success in the printer business, reliability is a given. What's more, the new EPL-6000 is compatible with application software written for the HP LaserJet II.

As for value, this new Epson combines solid, businesslike performance with a price that is as attractive as the printing. In fact, for quality, reliability and value in a laser printer, you could say Epson has the solution well in hand.

WHEN YOU'VE GOT AN EPSON, You've got a lot of company."

Software for political advantage

BY CLINTON WILDER

OAKLAND, Calif. — The Environmental Defense Fund (EDF) is not in the computer business. Among California utilities, however, its software has become the kind of industry standard that companies like IBM and AT&T dream about.

An energy-use forecasting program called Elfin, developed by EDF economic analyst Dan Kirshner, is now the required model for California utilities applying to state energy regulators for rate adjustments or new construction. One utility, Southern California Edison, is currently using the EDF model for four different regulatory filings, including its proposed merger with San Diego Cas & Electric.

The story of Elfin is a tale of technology for competitive advantage — but on public issues, rather than in the marketplace. It is also the story of how EDF, a New York-based nonprofit environmental advocacy group, became a software vendor of sorts.

Developed by Kirshner in the late 1970s as part of EDF's effort to fight nuclear and coal plant construction, Elfin has helped revolutionize energy planning in California.

"It has served to eliminate the mystique of the modeling alchemist," says Lon House, chief resource planner at the California Public Utilities Commission (PUC) in Sacramento. "Before this common model standard, only the power companies and the PUC really knew what was going on. Now anyone with a PC.

can afford Elfin and can do their own filing using their own assumptions."

In the late 1970s, Pacific Gas & Electric mounted an ambitious campaign to spend several billion dollars building nuclear and coalfired power plants in the 1980s. While many opposed the plans on safety and pollution points, EDF's arguments were economic. EDF specifically objected to assumptions about future energy use that PG&E had made based on its mainframe forecasting models.

EDF hired Kirshner, then 22, an economist by training but a computer techie by proclivity, to help it challenge those models with a new one. The more flexible EDF model allowed calculations using different types of assumptions, most importantly future energy-saving measures such as conservation and cogeneration.

"There's only so far you can get by just questioning," Kirshner says. "At some point, we had to come forward with an alternative. We needed to analyze what the utilities were doing on their own terms."

EDF's Kirshner developed energy forecasting software that is now standard in California

Kirshner developed the first version of Elfin, in Fortran, on a Control Data Corp. 6400 at the nearby Berkeley campus of the University of California. He later wrote a Unix-based front end; Elfin is now available in micro and mainframe versions.

Although Elfin originally

helped EDF win a victory for environmentalists, it is now used by the utilities themselves as a business planning tool.

"It's very cheap, easy to learn and runs long-term planning forecasts much more quickly than the CPU-hungry models," says Luis Pando, a planning engineer at Southern California Edison in Rosemead, Calif. "Our next long-term plan will be run

only on an Elfin model." Edison runs Elfin on MVS on an IBM 3090 Model 600.

EDF's adversary in the original 1970s case, San Francisco-based PG&E, has not embraced Elfin quite so enthusiastically but does run it on its VM/CMS-based Amdahl Corp. mainframe for regulatory filings.

"It's not PG&E's preferred model for planning purposes," says Lawrence Risman, a consultant in computer modeling for production simulation. "It's required by the regulators, has convenience

and a fairly quick turnaround time."

Elfin has helped PG&E and EDF work more closely together than in the contentious days of the past, according to Risman. "There's been quite a bit of water over the dam since then," he says. "We're happy to work with

a model from whatever source."

PG&E and Southern California Edison pay EDF about \$18,000 per year for Elfin mainframe licenses; other third-party mainframe or minicomputer-based forecasting models typically cost around \$80,000 annually, Pando says. The PC version, which requires an Intel Corp. 80386-based machine, ranges between \$6,000 and \$10,000 per year. EDF brings in about \$120,000 per year in licensing fees, all of which fund continued enhancement and development of Elfin, according to Kirshner.

"You could say [Elfin has] been a success as a software product, but if we were for-profit, we wouldn't consider it a very worthwhile endeavor," Kirshner says. "We have a California niche, but it would be nice to exploit that elsewhere."

EDF's true measure of success, however, lies in opening up energy planning in California through the use of information technology. "We used to hear that the power companies had to build these plants or the lights will go out, and we only had their models to go by," says House. "Now we can test different conservation assumptions, gas price assumptions, anything. We have a completely open process."

"The [energy planning] game is not models, it's assumptions," Kirshner says. "But that was never clear until everyone was using the same model."

Peterson

EDOM DACE 72

Detroit area. His career has taken him from Detroit to California to New York, where he and his wife now reside in an Upper East Side co-op. An avid slicer, tennis player and golfer, Peterson manages to return to his Los Angeles-area home a few times a year to pursue those interests.

After graduating from MIT and serving a brief stint as a civil engineer corps officer in the Navy, Peterson joined Honeywell, Inc.'s temperature control business in Detroit, as his father had done. When Honeywell started getting involved with computers in the 1960s, Peterson was intrigued and returned to school with plans to get into the dawning industry.

Armed with an MBA from the University of California at Berkeley, Peterson went back to Detroit to work in IS at Ford Motor Co., modernizing the company's operations and product development systems. His varied career has been uphill ever since, marked by distinguished terms at Citicorp, RCA Corp. and, most recently, Security Pacific Corp., where he was executive vice-president of the bank's Automated Data Processing Group for several years.

Peterson came to Merrill Lynch in 1986. "There's been a lot of change since he's been here," Eli says, noting that both IS budget and staff have declined, and the group is more control-conscious.

Damage control

As Wall Street continues to undergo brokerage industry contractions, Merrill has been one of the hardest-hit firms, because of its freewheeling expansion during the boom years of the 1980s. Peterson's charter has been to control costs while continuing to deploy technology to Merrill's strategic advantage.

In light of layoffs and budget

In ignt or layons and budget cuts, some might reaent Peterson's large salary, but colleagues defend it. "He deserves every penny of it. He's added 10 to 100 times more than that to the firm," Turkstra says.

Peterson says that his status gets him "a lot of notoriety," but colleagues describe him as first and foremost a family man. No doubt he has helped inspire two of his three children to become involved in the business: One is in telecommunications at Procter & Gamble Co., another in the computer center at Pacific Bell.

Peterson is apparently not without a mischievous bent — at least according to another high-profile IS executive with a pen-

chant for same. George Di-Nardo, executive vice-president of information management and research at Mellon Bank NA and a friend of Peterson's, speaks of participating with Peterson in an IS research group in New York.

"We were always fooling around at meetings; now they make sure we sit at opposite sides of the table," DiNardo laughs. But he adds, "He's absolutely a gentleman and a wonderful person."

Peterson's management philosophy? "I like to hire the best people I can get my hands on, give them the authority and the tools they need to get the job done — then let them have some fun," he says.

Subordinates agree. "Du-Wayne has a unique ability to let his people show initiative while establishing a vision," Turkstra says.

Eli characterizes Peterson's informal, entrepreneurial style as "more California." "He sets goals and expects everyone to live up to expectations," he says.

Where do you go from the top? Peterson says he will finish out his working life at Merrill. "I'd like to retire eventually, maybe do some consulting," he says. But when that time comes, he says, "You stop and take stock of your life. This business moves so fast."

PRODUCT SPOTLIGHT

ELECTRONIC DATA INTERCHANGE

Take a close look before getting on the wire

BY ROBERT PAYNE

onducting business electronically is not an idea that rests easily on executives' minds. While it has gained more widespread acceptance (some numbers place the rate of growth at 45%) electronic data interchange (EDI) has not been

the fastest off the block. A welter of questions arise when a company considers committing to exchanging business inforelectronically. Standouts include: Are EDI transactions secure? Do they require extra care? Can I change my existing system to accommodate EDI traffic? Does working with trading partners need a lot of effort? And what is "store-andforward," anyway?

If your company has recently committed to EDI, you have no doubt wrestled with some of these questions. And no doubt another large decision looms: whether to create your own EDI setup or pay a third-party network to do your transactions for you. You do not have to be the size of Wal-Mart Stores to reap the cost benefits of building your own

benefits of building your own EDI network. At the same time, you may prefer the expertise and added value offered by the thirdparty network providers.

To ease your way into EDI, you must first understand just what EDI requires of a network, whether you make or buy it.

By their very nature, EDI transmissions need to be handled with extra care. Beyond getting orders right, companies using

Payne is a managing partner with EDI, Spread The Word, an EDI research and consulting firm in Dallas. EDI to notify banks to pay suppliers expect 100% accuracy. With customer orders, remittances and acceptance notices coming and going over the wire, timeliness of data is also essential.

The network must also handle unpredictable peaks and lulls of EDI traffic. With more emphasis on just-in-time operation. For instance, a candy firm tells how K Mart Corp. put in a single order for Valentine candy to fill all of its stores. The firm will probably not receive another order from K Mart for several months.

Because it is system-instead of sales force-dependent, EDI traffic continues throughout the convenience, without assistance from the sending company.

With this capacity, only the network must be maintained around the clock; the application systems themselves can be disconnected. This is a relief to the information systems group, which would not want to provide 24-hour production support for a

complex purchasing sys-

As EDI progresses in the organization, the net-work will need to examine inbound transactions in the electronic mailbox and distribute them to diverse departments, taking on the characteristics of an

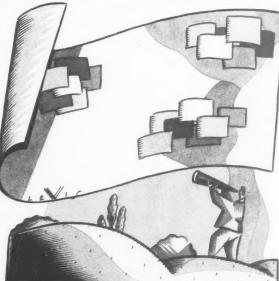

electronic post office.

Just as volume varies among trading partners, so do other physical characteristics of the data. For instance, there are many types of emulation software, including IBM Systems Network Architecture, asynchronous or bisynchronous software, and the network needs to handle each type.

The network must also accommodate a variety of line speeds. Most of the automotive manufacturers send material releases at 2.4K bit/sec., while other industries transmit their data at 4.8K bit/sec. Even

when a manager knows that a 2.4K bit/sec. connection needs to be available, other questions arise — such as, will it be 2780-or 3780-based?

Another factor that distinguishes the EDI network is its need for expandability. Many EDI programs in the U.S. are growing at a rate of 10 trading partners per month. Southern California Edison set a record in 1989 when it added 100 trading partners in 90 days. By mid-1987, Wal-Mart Stores had several hundred telecommunications connections with trading

The Levis

customers make more frequent orders for a smaller volume of goods. Others send large batch orders, once a day, once a week or occasionally once a season. night. This need for 24-hour access and uptime has spurred the popularity of "dial-in" capacity. Customers can access and pick up outbound documents at their

ware to keep costs

low. Page 90.

FROM PREVIOUS PAGE

partners and is adding new ones. By late '89, it had the greatest number of standard EDI trading partners of any company, with a total of 1,810.

Furthermore, the number of transactions for each trading partner increases over time. Pilot projects grow to parallel tests and then to production volumes.

Beyond physical network requirements, there are also human operational requirements. Remember how long it took to install your latest intracompany network drop? While you do not have to multiply this by your total number of EDI trading partners, you may need many months of installation time, including training time.

Although there have been no reports to date of unauthorized trading partners gaining EDI access, managers are very con-cerned with security on EDI networks. Because of the cature of the data, it is important to have error correction, security and audit trails on the network. A good deal of security is built into EDI formats as well (see story page 86).

Other good practices on the network are uninterruptible power supplies and line or switch redundancy.

With these requirements in mind, managers can decide whether it is to their advantage to make or buy each component of the network.

While most new users are opting for third-party networks almost 85%, according to estimates from the EDI Yellow Pages database — there are cases when building your own will save money.

One example is when your company already has a substantial network set up for intracompany communication. Since the prime technical difference between the two types of networks is the number of drops, you may just need to increase network capacity and the number and location of lines.

You should first assess whether there is unused capacity on the current network that could be allocated to EDI traffic. If not, you need to calculate the cost of adding capacity as well as lines local to the trading part-

Other considerations need to be attended to as well, such as expandability, variable peak traffic times and 100% uptime. Managers should plan on adding

tion centers and stores, but it also reached Allstate Life Insurance Co., Dean Witter Reynolds, the Discover card and more. The network has over 135,000 terminals in 7,000 locations and reaches about 800 Sears suppliers, according to Lance Dailey of the Sears Merchandise Group.

Even this network will need to expand to carry more EDI traffic. In all likelihood, the number of locations on the Sears network will more than double to fully implement EDI.

At the other extreme, companies that plan on sending a large

volume of transactions to a small number of trading partners may choose to build EDI networks specific to those companies.

For this to be cost-effective, company the should not planning to expand to include more partners.

All in all, building your own EDI network is not something to be taken lightly. Before even consid-

ering technical issues, there are EDI-specific concerns to address. For instance, coordinating trading partner relationships almost always takes longer than expected.

In addition, each procurement of equipment means evaluating, selecting, installing and testing the equipment and then training your staff to use it. The new equipment will add operating costs and depreciation costs as well as amortization of leases, which will be charged to the manager. Monthly payments to telephone companies may be another ongoing cost. Finally, there is maintenance to consider. If you have little internal teleexpertise, communications expert there may be consultant fees.

For companies looking for simplicity, the route to take is to sign on with one of the 15 available third-party EDI network providers. These providers have a lot of experience in meeting the requirements above. Even the K Mart candy order is not a particularly large volume for a third-party network.

A range of several hundred to a few thousand users make use of these networks, and the providers will expand as necessary.

Other equipment, such as concentrators, trunk lines and central processors, is also expandable on these networks.

The networks also offer around-the-clock access seven days a week except for a few hours weekly that are necessary for maintenance and backup. Most of the networks are castore-and-forward

Continued on page 86 Wright is a Dallas-based attorney.

Don't sign until you've read all the fine print

BY BEN WRIGHT

As an EDI user hiring a thirdparty network provider, you need a robust service agreement. These providers are not regulated by the Federal Communications Commission, so the agreement is the keystone to the service relationship.

In addition, once you have decided on one provider, it becomes difficult to switch. Not only do you spend time and mon-ey establishing a working relationship, but a move to a different service could disrupt your trading partners as well. So it's important to get it right the first

A provider usually has its own standard form, which covers issues important to it and employs language that favors its interests. It is imperative, therefore, for the customer to review the agreement carefully and revise it as necessary. The following should be considered in the final

• Complete statement of terms: The agreement should state all the network provider's obligations, including the responsibilities for user support and data transmission, translation, storage and delivery. One way to ensure that all points are covered is to reference the network provider's product literature within the actual agree-

• Data ownership: Just as an unpaid mechanic can assert a lien for servicing an automobile, a network provider could retain data if the customer fails to pay the network's charges. To preclude the possibility of business disruption in the event of a billing dispute, the agreement should confirm the customer's absolute right to data.

• Confidentiality: The service contract should establish precise obligations to protect data confidentiality.

While laws such as the Electronic Communications Privacy Act (ECPA) protect the privacy of electronic messages, their application is complex and sometimes confusing. Few court decisions have interpreted them

What is more, although these laws inhibit a network provider from voluntarily disclosing data. they do not require security measures to be used on the net-

It may be wise to mandate the regular purging of backup files. EDI transaction and pricing data could prove quite a tempting target for a corporate spy or antitrust plaintiff's lawyer.

• Investigations and audits: It is possible that a taxing authority or investigative agency would order a network provider to release a client's information.

Customers can attach a clause to their contracts that requires the provider to notify them before releasing any information so that they can monitor or contest such attempts.

Under the ECPA, however, law enforcement authorities can delay customer notification. This provides extra incentive to insist that the provider erase backup reasonably quickly.

• Liability for errors: The agreement should divide the responsibility for risk - including data loss, delay, misdirection and total cessation of data traffic between network provider and customer.

Typical network form contracts obligate the network to restore, rerun or correct lost or impaired data. But providers are hesitant to offer additional remedies, such as paying damages for breach of contract. Their rationale is that with increased liability, they would have to charge higher rates.

However, customers should insist that providers be liable up to some point for their mistakes. After all, the provider is often in the best position to prevent er-

In addition, exposure to liability will motivate the network provider to maintain quality service. Keep in mind that you will probably not receive a full guarantee of flawless performance.

 Amendment: Services will inevitably change, and the agreement should be made subject to amendment in the event of changes. In addition, customers should be given advance warning (approximately 90 days) on any adverse changes made to the network, such as altered proto-

• Termination: The customer should be given sufficient warning of the termination of the contract and possibly even the option to extend services beyond the effective expiration date.

Certain obligations should continue after the agreement ends. These might include confidentiality and the availability of documentation for audit, legal and tax purposes.

more lines than they would use for a similar intracompany requirement. Also, because of possible increases in volume, additional controllers and ports may be required.

To accommodate the various line speeds and emulation software of each trading partner, you will need a variety of modems and multiplexers to accept transactions. You will also need to spend time with each partner to carefully coordinate the particular network strategies.

In the late 1980s, Sears Roebuck and Co. opted to expand its existing capacity to accept EDI traffic. Not only did its intracompany network carry information among headquarters, distribu-

Why EDI?

In its report, "The State of U.S. EDI: 1989," EDI Research, Inc. asked 423 users who are either using or planning to use EDI to provide the main reasons why they are doing so. The survey was designed to elicit open-ended responses, allowing respondents to express their own answers. The responses were then grouped to represent as nearly as possible the words of the respondents.

Coming in at 49.9%, "speed and reduction in lead time" was the most common answer, receiving more than three times as many mentions as any other category. The second and third most frequently mentioned benefits — which resulted in a tie 'customer request' and "cost efficiency" at 15.1%. Increased "accuracy" at 12.5% was the next most popular response, and customer service came in fifth at 3.6%.

It is interesting to note that some popular features of EDI are not perceived as very important by respondents. For in-'inventory cost control and reduction' was noted by only 3.1% of respondents, yet it is mentioned frequently by proponents of EDI as a major benefit of implementation.

Liebert Corporation Marketing Services 1050 Dearborn Drive P.O. Box 29186 Columbus, OH 43229-9979

When the Noxell cosmetics company decided to change the complexion of its computer support system, several companies applied.

Liebert was the most attractive.

It's really no surprise that one of the world's largest cosmetics companies—maker of Cover Girl, Clarion, Noxzema and Raintree beauty care lines—chose Liebert systems to power its round-the-clock, seven-day-a-week computer center. They needed an uninterruptible power supply (UPS) to perform unattended, providing a consistent flow of computer-grade power with battery-backup for complete protection where it's needed and expected—on the line.

Or that Noxell Corporation chose Liebert because it wanted a system that's reliable and backed by the largest service organization in the industry. After all, those are the base

ingredients in the Liebert formula.

The fact that the Liebert sales representative helped with the original site study to make sure the make-up company's computer system foundation was as flawless as possible didn't come as a surprise either. Nor that a MIS manager with 23 years of experience would choose Liebert at each system facelift.

What is a surprise is that the Noxell/Liebert system—which processes every invoice, shipping order, market study inventory and on-line production report in an industry where the competition could turn ugly at any moment—is completely backed up by another Liebert system, just a mile and a half down the road.

At Noxell, Liebert backs up itself. Perhaps that's the ultimate definition of uninterruptible power supply...maximum uptime, clean, consistent power free of spikes, sags, surges, noise, outages or irregularities.

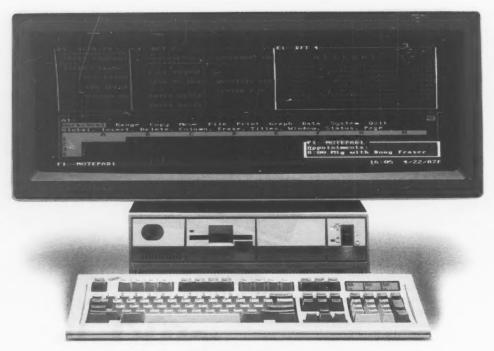

"Liebert works here (at the main center) with no trouble. So why not have it at the backup site?"

 Frank Martin, Manager/Data Processing Noxell Corporation, Hunt Valley, MD

Liebert may have the perfect make-up for your computer system. To get more information on Liebert's UPS systems, call **1-800-942-9477**. Or return the action card today and ask for *99 Reasons to Choose Liebert*.

NEW EXTRA! EXTENDED FOR DOS

Introducing new connectivity software to stretch your possibilities,

Attachmate's new PC-IBM° mainframe solution shatters DOS limits while extending your connectivity power.

EXTRA! Extended," with its superefficient EMS architecture, transcends the 640K DOS barrier to give you more room for PC applications.

EXTRA! Extended stretches DOS concurrency limits, too. At the same time you run host or DOS sessions in the foreground, IND\$FILE is transferring files in

LAN MEMORY REQUIREMENTS	FILE TRANSFER	CONNECTIONS
Without 77K*	Background: IND\$FILE	Gateway IBM TIC
With 62K* EMS *Minimum	Concurrent Send & Receive	Coax SDLC

the background. You can start transfers on the fly via a pop-up menu. No need to exit your PC application.

EXTRA! Extended opens other possibilities under DOS, including:

 Multiple concurrent independent mainframe connections;

- Cut and paste up to seven simultaneously displayed windows;
- Support for mouse and voice synthesis equipment.

EXTRA! Extended also extends
Attachmate's pledge of compatibility and
commitment to IBM's strategic direction.
That commitment is your best assurance
of solutions you can use tomorrow with
equipment you have installed today.

For full details and free demo disk, write or call now: 1-800-426-6283.

NEW EXTRA! FOR WINDOWS

and expand your horizons.

If you want this EXTRA! capability with Microsoft* Windows, then go for Attachmate's new EXTRA!

for Windows.™ It's built from the ground up as a true Windows application, and shows just how powerful—and easy—good connectivity can be.

Since EXTRA! for Windows makes more efficient use of Window's memory management, you get more room for your PC application.

You work in the fast, friendly point-

and-click graphical interface world, where pull-down menus, macros and mouse selections replace key sequences. Use dialog boxes to readily make connectivity choices, and configure, open and manage multiple sessions simultaneously. With your clipboard, you can easily transfer data between mainframe sessions and other Windows applications.

There's no end of connectivity options.

Attachmate

Up to 26 simultaneous host sessions, each in its own window, can be moved, sized or iconized. EXTRA! for Windows supports coax (CUT and DFT) and LANs—including IBM's Token Ring Interface Coupler (TIC). And it's functionally compatible with IBM's High Level Language API (HLLAPI).

As with EXTRA! Extended, EXTRA! for Windows includes Attachmate's commitment to IBM, today and tomorrow.

For full details and free demo disk, write or call now: 1-800-426-6283.

Attachmate Corporation, 13231 S.E. 36th Street, Bellevue, WA 98006 (200: 644-4010

Battening down the hatches

ecurity is a top concern for EDI implementors. Beyond network security, EDI formats themselves offer built-in checks and balances.

One of these is via control numbers. which appear in the header and at the bottom of the document. This works as

a tracking device should questions arise as to the timing of the document's movement or receipt. The number also appears on audit trails, for ongoing data processing auditing.

In addition, if the bottom of the document gets eliminated, the network

would recognize this. It reads the control number in the header and matches it to the number at the end. If the network finds that the numbers do not match, it alerts network operations personnel as well as the sender of the

EDI also has control totals. As the sender builds the electronic document, EDI software counts the number of records and then notes that total in the trailer segment. The recipient can then see whether a record has been eliminated.

The checking mechanisms intrinsic to the document can go two steps further. An inner envelope will have its own control number and control totals in its trailer.

In addition, some of the data values

can be totaled and then stored in trailer records. An example is the total quantity ordered in a purchase order.

A more common and definite confirmation is provided by the receiver sending back a functional acknowledgment,

gous to a postal return receipt. If the manager sends a document and does not receive an acknowledgment, he retransmits or looks into the problem.

Unauthorized access is another concern. One solution is to allow dial-in access to only a small portion of the network. In addition, before information is sent to in-house applications, it is examined closely for valid ID, control numbers and control totals.

ROBERT PAYNE

Continued from page 82 services, in which they dial out to a trading partner on behalf of the manager. All of them can store and receive. In addition, peak traffic times tend to level out across this larger, more random trading-partner community.

The providers are also capable of re-

ceiving transmissions from virtually all commercially available modems and can adapt to basically all protocols. Because companies communicate with only the third-party network and not individual trading partners, different line speeds and protocols are transparent.

The third-party EDI networks are also in the business of protecting against electrical storms, power outages and other disasters. They use error-correcting software, and security is rigid and subject to external audits.

Networks are accustomed to providing audit trails, transmission recovery and redundancy to a great degree. Lines are continuously monitored by sophisticated equipment and experienced people.

In addition, the networks have all developed software to carefully use the checks and balances intrinsic to EDI headers and trailers. Third-party EDI network software detects if a trailer happens to be missing or if the count of the segments is incorrect. These networks clearly indicate such occurrences on the audit trails that are available to users.

Pricing algorithms vary on the networks, but in general, the cost of sending and receiving a simple two-line item purchase order varies from about 55 cents to 90 cents. Most network providers charge a monthly fee and offer volume or monthly discounts.

Despite the services offered by thirdparty networks, there will always be companies that prefer to do things on their own. For this reason, a handful of vendors have begun offering software that simplifies some of the technical issues involved with setting up your own network.

Vendors offering such software are American Custom Software in Cookeville, Tenn.; Mpact EDI Systems in Livonia, Mich.; Stratus Computer/Scientific Soft-ware; and Ordernet Gentran in Columbus, Ohio.

Generally, this software assists in scheduling telecommunications sessions and allows trading partners to dial in to retrieve messages. It offers some contingency requirements by checking control numbers and control totals intrinsic to EDI headers and trailers. It also produces

audit trails that are modifiable by the manager. Expandability is also possible.

Some of the packages also perform protocol conversion and handle multiple line speeds, obviating the need for some emulation software. Pricing for the soft-ware ranges from \$3,000 to \$128,000. The more expensive software can accommodate more lines and reduce the number of emulators and modems required.

Perhaps to counteract such competition, the third-party networks have started to offer additional services and technology on a fee basis. For instance, the third parties help in trading partner coordination as well as consulting and in-house training to the originating company or trading partners.

At your service

Some of these providers also offer database services. In these cases, they collect and analyze EDI data that passes through the network, such as trends in geographical, seasonal and company-size orders and then allow companies to access them.

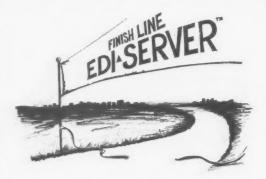

Ordernet offers a database of pharmaceutical usage built from actual EDI data moving among members of the pharmaceutical industry. It reads usage patterns among transactions and records and provides marketing information to be made available to the members of the industry.

GE Information Services and IBM (through Quick Response Services) provide databases of universal product codes (see story page 90).

Another service offered by the thirdparty networks is internetworking. If a trading partner will work only through a specific third-party EDI network, some networks enable you to communicate with that trading partner. Taken for granted in voice transmission, this capability is quite recent to EDI.

When venturing into EDI, it is vital to remember that new ground is being covered - new concerns for network data, new requirements for the network, new relationships with trading partners and essentially an entirely new way of doing business

The groundwork you cover before making any decision can alleviate the hours your EDI personnel will put in when you get down to the brass tacks of implementation. Taking a good look at your current mode of operations and network capacity and honestly assessing the capabilities of your IS department and the requirements that EDI imposes on any network is a good place to start. .

There wasn't any competition, but we ran fast anyway.

Responding to your need for an EDI software system that handles diverse EDI environments, American Business Computer races to the forefront with the release of EDIa Server.

EDIaServer offers a simple solution to the problem of fully integrating EDI into existing computer-based operations. EDIaServer addresses the variable requirements of any EDI project by providing unmatched support in the areas of Application Interface (API); Open Systems Interconnect (OSI) - (X.400, X.500); Data Mapping (X12, EDIFACT); Data Management; LAN Support (SNA and Ethernet); Real Time Processing and Multiple munication Protocol support

Pick the Winning Strategy ... American Business Computer

AMERICAN BUSINESS COMPUTER"

1958 Green Rd., P.O. Box 305, Ann Arbor, Mr. 48 (06-0305, (313) 930-7840, Fax: (313) 930-0198

ASK THE VENDOR

I currently use American Business Computer's personal computer translation software product, EDE-PC. I am interested in purchasing EDI-Excel for use on my IBM 3083 (MVS) to move EDI further into my business operations. I have heard that EDI-Excel has a use face that facilitates "no-hassle" data mapping. Please explain.

Lisa Scully EDI Coordinator Philips Lighting Co.

AMERICAN BUSINESS COMPUTER: EDI-Excel's Mapping Editor is an interactive method of relating application data location and format information to and from EDI standards. The Mapping Editor presents EDI information on the screen so that users can "cut and paste" data segments and data elements as well as specify their location and position to and from the application database. This way, users can create interpretations of EDI transactions and streamline the integration process. The Mapping Editor also performs consistency and completeness checks to ensure, for example, that data hasn't been mapped to the same location twice or mapped to the wrong location.

In a perfect world applications from different companies would work together like they came from the same company.

NAS. The performance of the second se

Digital's Network Application Support (NAS) lets you integrate applications and share information across your multivendor environment.

Up to now, the dream of getting all your applications to work together has been just that—a dream. Digital's NAS now makes it a reality.

NAS is a set of software products for using and developing integrated applications running on different vendors' systems. While other computer companies are still wrestling with how to get their own computers to work together, Digital—a company whose computers have always worked together—offers a way to get your applications to work together. Even those running on systems that aren't ours. In fact, NAS works across the widest range of systems in the industry.

NAS. How it works.

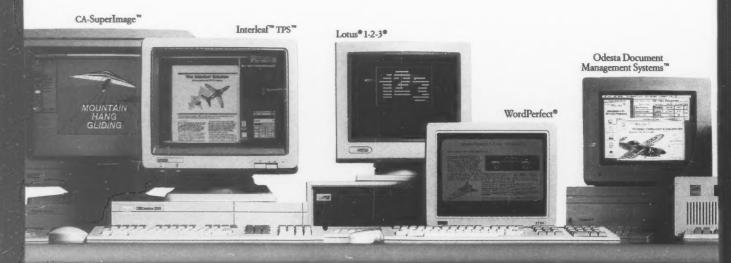

Using a typical example, we'd like to show you one of the many ways NAS can be used in your real-world environment.

You can take graphics from an Apple Macintosh,® a Lotus®

spreadsheet from an MS-DOS™ PC, a drawing from a UNIX™ workstation, data from an IBM® mainframe, a scanned image from the network and integrate them all into a single report. You can then send it electronically to others anywhere on the network, and even include up to the minute connections to source data. Sound easy? With NAS it is.

NAS. Why it works.

Achieving integration like this requires just the things Digital is very, very good at. Like networking. And

erfect solution erfect world.

software compatibility. And the adoption and promotion of open standards. Digital's leadership in these and other key areas is what makes NAS unique.

NAS. What it means to you. Simply put, NAS gives you unequaled freedom of choice.

For IS managers, NAS means you can choose to grow in any direction you want. Also, the systems you chose in the past will work with NAS. So, your investment is protected.

For developers, NAS means you can write software once and know it will work on other systems. Savings in time and money can be substantial, allowing you to focus on improving your applications or reducing the backlog.

For users, NAS means you can continue to use the applications you're most comfortable with, but also be able to share information with others much more easily.

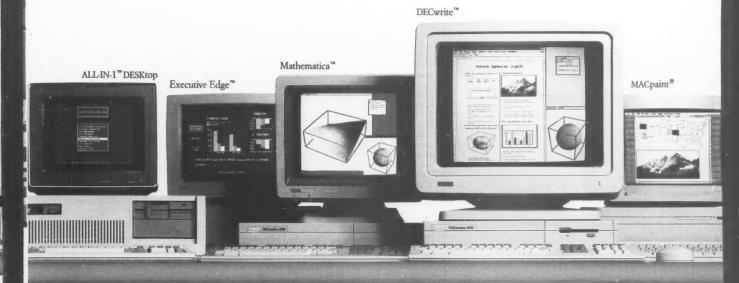

For the whole company, NAS means that with more computers working together, more people are

working together. That, of course, means more productive workers and the ability to compete more effectively.

NAS. Available now.

Getting all your applications to work together is not some promise, somewhere down the road. NAS is here. Now. For more information on NAS, call 1-800-842-5273 ext. 215. Or call your local Digital sales office.

Digita has it now.

Retailers dress up EDI systems

BY LISA GUISBOND

Some companies that have already gotten their feet wet with electronic data interchange (EDI) are starting to wade even further into the technology. Among those venturing into deeper waters are apparel manufacturers and retailers, which are starting to integrate new technologies into their EDI systems to exchange bar-coded data, graphics and computer-aided design and manufacturing (CAD/CAM) information.

The reason behind this integration push is related to business, not technology, says Lane Cooper, senior editor at "EDI News," an industry newsletter.

You not only want to integrate CAD/CAM, funds transfer and computer-integrated manufacturing in EDI," he says. "You also want to figure out ways to provide value-added services in addition to your product.'

In the retail industry, the attempt to add value is called quick response - the U.S. retail industry's answer to competition from imported goods. Quick response is a strategy for streamlining the movement of goods from manufacturing to point of sale and cutting inventory costs.

With the recent trend in the retail industry of introducing a new style each month - as opposed to the past practice of one per season — quick response is more than a slogan, it's a marching order for such recognized

Guisbond is a free-lance writer based in

Let CICS

leaders in EDI as Liz Claiborne, Inc., Milliken & Co., Hagar, Dillard's Department Stores, Inc. and Levi Strauss &

Liz Claiborne in North Bergen, N.J., is looking to emphasize the "quick" in quick response by integrating new technologies into EDI. It has set its sights on exchanging CAD/CAM-based de-

sign information with textile manufacturers and its overseas contractors. The firm has used personal computer-based CAD/ CAM systems for three years, says Victor M. Soto, director of CAD/CAM at Liz Claiborne.

Soto says he anticipates that within the next 11/2 years, Liz Claiborne will exchange such CAD/CAM design information with overseas trading partners. Currently, the firm transmits cut patterns to its own operations overseas via satellite. The patterns are then delivered to factories for production. But this is not yet full EDI.

The first job is to implement the [CAD/CAM systems] inhouse," Soto says. After that, he envisions the exchange of CAD/ CAM information as a way to accelerate the turnaround time in garment production.

Wrangler in Greensboro, N.C., is another apparel manufacturer that is part of the EDI vanguard. The company is expanding its EDI program, dubbed Wrangler Wire, to include bar-code scanning of inventory as part of an effort to get the right styles in the right quan-

tities and the right sizes through the pipeline to the point of

Wrangler currently relies on a purely manual inventory system, according to Brian Goldberg, vice-president of retail services. Wrangler's

stock counters must travel to thousands of stores to manually count inventory and then phone in replenishment orders.

With the bar-coding program, Wrangler's retail partners will be able to scan their barcoded inventory weekly - as opposed to every four weeks using a handheld scanner based on the ANSI X12 standard for the apparel industry. Upon receipt of the data, Wrangler's system will automatically generate orders, taking into account the status of shipments - that is, what is in transit, unshipped or already received.

Wrangler is also participating in the development of a system to outfit retailers with instant access to the company's latest product line. Rather than waiting for a seasonal visit from a Wrangler salesperson, the retailer will be able to view digitized images of product lines on a fullcolor, high-resolution graphics workstation.

The workstations are being developed by IBM Information Network and Quick Response Services, a division of Peter R. Johnson and Associates, which is partly owned by IBM.

"The retailer will sit at a workstation and look at our product selections," Goldberg says. "If they want to view a specific product, say acid-washed indigo jeans, they would press that button and get a close, tight shot, like looking at a page of the catalog.

If they like what they see, Goldberg says, they could create an electronic purchase order and transmit it to Wrangler, initiating the whole EDI exchange.

John Simon, Quick Response Services' vice-president of development operations - and a former retail buyer and store manager - sees other potential system applications. "There's a big need in a retail environment to transmit descriptive information like pictures to various stores," he says. "They could use it in an ad, in training seminars and in in-store videos.

Service stretch

Third-party network services such as GE Information Services' (GEIS) Design Express are also expanding the boundaries of EDI by allowing apparel companies to transmit design patterns and related information to manufacturers worldwide.

Integrating these technologies will mean familiarizing people with a whole new method of doing business, says GEIS product marketing manager John Schmarr. This is not unlike the education required when EDI was just entering its infancy.

That effort required a lot of internal changes to the way manufacturers and people did business," he says. With the added concerns of international standards and data that is considered proprietary, a lot of security needs to be built in, he adds. •

Getting by with just the basics

BY JAMES MOSES

If you have been dodging requests from a trading partner who wants your company to become EDI-capable, it may help to know that there are things that you can do to satisfy such requests without depleting your systems budget.

Rather than set up a mainframe- or minicomputer-based system that collects inventory statistics and performs business analyses, many companies are getting away with a more minimal electronic data interchange investment.

For companies unwilling to invest in any kind of EDI capability, some third-party networks offer media conversion services. These services allow companies to receive EDI messages. The hub company sends its EDI message through normal EDI channels to the third-party network, which then forwards the message via facsimile, telex or electronic mail to the recipient. Of course, such services work in only one direction; that is, the recipient cannot then send a mes-

Moses is the founder of Primary Research Corp., a technology research firm in New York

sage in return.

Another option is to set up a minimal EDI configuration with a modem, a personal computer and a basic PC translation software package. "If the small firm says, 'This is the only EDI customer that I will have to deal with' and if it's for a limited number of transactions, [PC translation software] is a good way to get started," says Dan Codman of the APL Group, Inc., a Con-necticut-based EDI software

When this software sends a transaction, it translates it from the application format into a commonly agreed-on format, such as ANSI X12. Upon receipt of a transaction, it does the re-

The limitation is that you cannot perform a large volume of business analyses, such as studying incoming purchase orders to see what type of product is selling well, from which geographic region and at what time of the

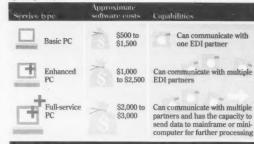

year. With their limited capability, he adds, these packages are relatively inexpensive and easy

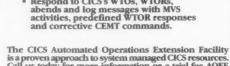

When Elec-tel Supply Co., an electrical products distributor, was asked by one of its major customers, Georgia Power Co., to look into EDI capability, it decided on a basic PC package from Georgia-based Grace Computer Resources, Inc. "We already had the PCs, so it was just the software costs and the connect charges," says Brian Wright, Elec-tel's EDI coordinator.

Rather than using a modem, Elec-tel chose GE Information Services' third-party network to transmit its data. The organizationeventually switched third-party network, which Georgia Power was also using. "Originally, we were payusing \$100 a month for GE's net-work," Wright says. "IBM charges us according to usage, so now we pay about \$50 to \$75 Continued on page 91

Back to basics

ASK THE VENDOR

We're an international freight forwarder and customs broker. We coordinate the shipment of cargo to and from overseas plants. Our customers want to be kept informed about their shipments throughout this process. Can your Ediflex translation package handle all of the domestic and international standards and proprietary formats that we deal in?

Roger Moll Vice-President of Operations Walker International Tranportation, Inc. Jamaica, N.Y.

H. B. ULRICH & ASSOCIATES, INC.: Ediflex is table-driven, so users can implement and customize any number of electronic data interchange standards definitions, as well as their syntax, messages and data dictionaries, with unlimited versions of each. With Ediflex, users can implement new messages, custom requirements and new standards.

This also extends to translation applications that involve no real EDI standards at all but just the proprietary data formats of a company and its trading partners.

I use Trading Partner, TSI International's EDI management software product. I've heard about a feature it is incorporating called Applications Gateway. What is this feature, and how will it affect my existing implementation?

Dennis Peabody Manager, Development Support Services National Semiconductor, Inc. Santa Clara, Calif.

TSI INTERNATIONAL: The Applications Gateway was developed to handle the difficulty of integrating EDI data with production applications. The Applications Gateway will allow you to define the mapping of EDI data using interactive screens. You can perform file and table lookups; EDI data can pass through the same edits as other application data; and you can create screens for viewing, modifying or approving EDI data before processing.

I know that Universal Software's EDI file transfer package, Universal-Link, runs on bisynchronous networks, but does the company plan on supporting SNA when and if EDI comes to the world of SNA?

Bill Schneider Data Processing Manager Central Transport, Inc. Warren, Mich.

UNIVERSAL SOFTWARE: VTAM/SNA support for Universal-Link is under development and is expected to be available by June of this year.

Getting by

CONTINUED FROM PAGE 90

per month.

When they first started using the EDI system, Elec-tel and Georgia Power used paper along with the EDI transaction — a common practice for small firms just getting accustomed to EDI.

"A parallel system existed for a long time — about a year and a half or so — while we got the bugs out," Wright says. "The software hadn't been fully debugged, and there were things like printing errors in the translation software."

Starting small does not necessarily mean that you have to stay small. Many packages are upgradable to accommodate more trading partners or become integrated with a company's corporate mainframe.

Strong Tool Co., a distributor of industrial tools in Cleveland, found that its EDI needs evolved beyond the initial setup.

The company started out with PC translation software from GEIS to satisfy General Electric Co., a major customer. The implementation was so successful that Strong Tool decided to expand to exchange EDI information with two automobile companies as well.

While it could have expanded the GE software, it instead chose a package from American Custom Software. For one thing, according to Dana Basinger, Strong Tool's EDI coordinator, the vendor specializes in auto industry standards.

In addition, it offered a maintenance/update option for only \$150 more than the standard \$2,000 purchase price.

Originally set up to communicate with Ford Motor Co. and General Motors Corp., the software later underwent a \$350 upgrade to include Chrysler Corp.

Many packages are upgradable for an added cost of \$300 to \$1,000. If no upgrade is available, the user must purchase a whole new program.

Over time, Strong Tool opted to route incoming EDI data to its corporate main-frame.

While Strong Tool developed this capability in-house, many EDI software suppliers offer upgrades to the mainframe or minicomputer. The average cost for this kind of upgrade is \$300 to \$500. ●

Goal's 1990 Spring Seminar Series

Now that another decade is underway, new trends and announcements will affect how you run your data center. We've been doing our homework on what it takes to be a truly effective data center; and we're applying this knowledge to our products. Come see the shape of the things to come in 1990 at our one-day product seminars—compliments of Goal Systems. We'll even let you copy our homework.

Production Automation - Learn why JOBTRAC is setting new standards in job scheduling and rerun/restart.

DB2 - Learn what you can do to make sure the applications you are now developing will be efficient when you take them into production.

Automated Output

Management - Learn how progressive data centers use integrated report distribution, report balancing, and online report viewing to improve service to their users and manage budgets.

Automated Disaster Recovery - Learn

about the new approach toward disaster recovery, more than just planning, it involves proactively preparing for assurance of business resumption.

EFT: If money could talk...

BY WILLIAM BRANDEL

Many companies are hesitant about implementing electronic funds transfer. To several, the idea of paying trading partners electronically upon receipt of an invoice raises more doubt than enthusiasm.

As long as a payer can take advantage of the time it takes for a check to arrive via mail and then clear a bank — the "float" period — the benefits of EFT will remain questionable. There are also issues of expense to consider when imple-

Brandel is a free-lance writer based in Boston.

menting EFT, such as accounts payable system changes, education of purchasing staff and vendor renegotiation of payment terms

But many large corporations that are receiving and sending payments via EFT—such as General Motors Corp., Sears Roebuck and Co., General Electric Co. and IBM—swear by it, and they are encouraging others to join.

"Seventy percent of one business computer's input is actually the output of another business computer," says Jerry Hershney, an analyst at Sears in Chicago. "If you eliminate the paper, you eliminate mailing time and reduce clerical expense as well as clerical errors and the time needed to correct them."

However, even EFT proponents are grappling with a question that has yet to offer an easy answer: How do you coordinate the electronic transmission of payments with the information that accompanies it? "The fundamental issue is no longer

the technology; the technology is there," Hershney says. "The issue is, should the payment accompany the remittance data that goes with it, or should it be referenced and sent via a different route?"

Remittance data is information on what is being paid for, how funds should be processed and to which accounts re-

and to which accounts receivable area they are to
be applied. While the payer
and payee banks take care
of funds transfer on either
the automated clearinghouse (ACH) network or
on the Federal Reserve's
Fedwire, there are several
ways to transmit the data.
A company can send it via
paper, a third-party net-

work, the ACH network or a proprietary EDI network.

Some of the argument has technical origins. Originally structured for banks to exchange funds among themselves, the ACH cannot accommodate large volumes of data traffic. The oldest format, Cash Concentration and Disbursement (CCD), limits data to 94 characters. The latest two are Corporate Trade Exchange (CTX), which offers variable-length records, and CCD+, which adds standard-format 94-character records. The only problem is that not all banks are yet able to process these formats.

Some observers see the separate vs. together debate as a business issue. "The issue is, how do I want to conduct my business payments?" Hershney says. For some vendors, he says, it may be advantageous to get the remittance data early to start processing payment. At a company the size of Sears, however, Herslaney says that it is better to receive both at the

"It eliminates the reconciliation problem," he says. "It's difficult enough to reconcile a personal checkbook. Imagine if you have millions of accounts that the funds could possibly be applied to." More often a payer than a payee, the firm has not been dogmatic about its approach.

General Electric Financial Services (GEFS) is also flexible on the issue. "We do it both ways," says Charlie Harp, manager of electronic payment systems at the company. "We will take it any way that our customers will pay us." Each of the firm's five payment centers accepts any ACH data format.

By offering its partners a choice in sending data and value or just value, GEFS feels it could get a broader base of vendors to pay electronically.

"The initial idea is to get the broadest penetration possible," Harp says. "We've found we can get a broader active participation from our vendors' banks if we did not require" the CTX or CCD+ format.

About 14,000 banks in the U.S. are on the ACH network, whereas 30 to 40 are compatible with CTX, Harp says.

Currently, he says, 8,000 GE custom-

Currently, he says, 8,000 GE customers are making payments electronically. Not all companies that are getting into EFT are going for such a large-scale implementation, however. At Union Carbide Corp., simple is the byword.

"We've started with other companies in the chemical industry with whom we have reciprocal payment relationships," says Robert Morris, manager of money and banking operations at the company.

In addition to the technical aspects of EFT, Morris says, questions arose during implementation such as system compatibility between payer and payee banks. Further, Morris cites the currently insufficient Universal Commercial Code, which does not judiciate EFT between computer systems. •

The companies included in this chart responded to a recent telephone survey conducted by Computerworld. When a vendor is unable to provide specific information about its product, the abbreviation NP (not provided) is used. When a question does not apply to a vendor's product, the abbreviation NA (not applicable) is used. Further product information is available from the vendors.

How AT&T 800 Service can of the Pony Express.

keep you from going the way

The Pony Express was the most exciting, fastest way to send information in its day. But riders had to change their exhausted horses frequently. This was an accepted cost of doing business then, but today, switching from a worn-out 800 service can cost your company thousands of dollars.

But that won't happen if you choose AT&T. That's because AT&T uses out-of-band signaling. And only AT&T is using this technology to deliver the state-of-the-art 800 service capabilities you want today with its high-performance AT&T MEGACOM® 800 Service. For instance, AT&T is the only long distance company delivering ANI based on out-of-band signaling. Over 30 of our AT&T MEGACOM 800 Service customers are already enjoying the benefits of INFO II capability and the fastest ANI delivery available today.

In addition, because our architecture is ISDN-based, your 800 capabilities won't be limited only to ANI. We also offer call-by-call service selection, which maximizes inbound 800 call completions. And you get transmission of voice and data on the same line. Something not offered today by MCI.

And since our architecture is the global industry standard, you can be sure that your 800 investment will be protected in the future. That way, when you want to add new capabilities such as transferring 800 calls to another location or allowing customers to enter additional information or account codes while they're on the line, you won't have to start over from the beginning. The way you might with in-band signaling.

So don't put yourself in a position where you have to get another horse. Get set, not just for today, but for the future. With AT&T.

Innovation. Another AT&T advantage.

For more information, call your AT&T Account Executive or 1800 222-0400.

IN DEPTH

Clearing the dusty decks

Use an architectural approach to sweep out outdated systems

BY LAURENCE J. BEST

cene: Los Angeles comedy club. In the spotlight is Sam Kinison with his trademark winter coat, beret and wild-man hair. As the applause from the introduction dies down, he launches into his "dusty-deck" routine.

tine.

"And how about those old systems!
Spaghetti code — sequential updates
— even master files! You'd think
they'd never even heard of a database!"

Big laugh from the audience. He turns up the volume and says, "They were written in the '60s, and they're still around! I mean, how long are those dogs going to run?" More laughter, a smattering of applause, and he's in for the kill. Cupping his hands, he yells at the top of his lungs, "It's the '90s, for Pete's sake! CONVERT THEM!"

It's sad, but many large organizations are saddled with obsolete, "dusty-deck" information systems. But IS executives don't need Kinison to tell them to convert — they already know.

The problem is not a lack of desire. Rather, the real impediment is the enormous effort and risk inherent in development and conversion. Faced with the uncertainties of large-scale conversion, many organizations decide to stay with the devil they know for just a little while longer.

Unfortunately, as the years

Best is an independent consultant, lecturer and author based in Roches

drag by, dependence on these

outdated systems grows, mak-

ing conversion even more difficult. Old systems become less and less maintainable. The inevitable result is that organizations get stuck with sluggish, outdated systems.

Eventually, these firms are passed over by organizations that have been better able to harness newer technology for competitive advantage.

The problems are real: Breaking up a system into subsystems for conversion can help shrink individual conversions, but it can also result in final products that are kludges. On the other hand, a massive onetime conversion — often needed for a seamless, integrated result — is tremendously risky.

But wait; all is not lost. It is possible to deliver both incremental benefits and integrated end results. IS executives can take decisive steps toward meeting the conflicting goals of "demassifying" conversion while delivering incremental, continuous benefits

and producing an integrated end result. The key is to use a conversion methodology that uses an architectural ap-

proach to conversion.
This approach was successfully piloted at Citicorp's National Student Loan Business, which grew from \$250 million to \$2 billion in assets and substantially increased its customer satisfaction sur-

vey scores. All

this at a time

when conver

sion from older to newer systems was almost continuous.

It is possible to sweep out dusty old systems while your organization's business booms. The following are the four key themes to an architectural approach to conversion:

Data and process do not need to be converted together.

 An underlying program architecture can be implemented before conversion of individual processing functions. This sets the stage for a completely integrated final result.

 In transaction processing, converting transaction entry and editing without updates gives most of the benefits that users

 Old and new systems can share a common, integrated database to allow the function of old systems to be extended before actually eliminating them.

Separating data and process

Most projects convert data and process (i.e., programs) together. The problem is that this approach exposes the larger effort to problems from data or program conversion. Even if program conversion is perfect, data conversion problems can ruin the overall conversion effort and vice versa. A better approach is to first tackle data conversion and handle process conversion later.

The key to succeeding in an "independent" approach is to establish a data conversion subsystem. This is a set of programs that initially loads a database from the old system's master files and then maintains a database in parallel with the old files. Even when the old system's files remain in the "master" system, the benefits are great.

A parallel database creates the image of integration for inquiry and reporting functions.

Even if all data updates must

Michael Bartalos

- Four-step process aids conversion
- Convert without disrupting daily operations
- Old and new systems can share databases

still be made through the old system, the organization can reap enormous strategic benefits from an integrated database for inquiry and reporting.

End users can use standard database facilities for ad hoc queries. The applications programming department can use the nonprocedural facilities of fourth-generation languages (4GL) to create advanced reporting subsystems. These same facilities, combined with the normalized data structures supported by modern database management systems, can allow for extremely powerful inquiry facil-

Such facilities allow on-line

OST benefits of modern online transaction processing can be achieved by front-ending the old system with an on-line transaction entry and validation system.

users to gather all data needed to answer a question onto the screen at the same time, eliminating the need to jump from screen to screen. For example, this facility can greatly aid a customer service staff, which could then answer customer questions more quickly and effectively.

Architecture before detail

Older systems mix architectural logic with application-specific logic. This accounts for much of the difficulty in maintaining and extending these applications. A better approach is to separate generic application functions from application-specific functions. Doing so will dramatically improve maintainability and let IS add new application functions without affecting existing pro-

Most benefits of modern online transaction processing can be achieved by front-ending the old system with an on-line transaction entry and validation system. The operator uses the online facilities of the new architecture to enter new transactions, edit these transactions and re-edit transactions that failed a previous on- or off-line edit step. The application then formats transaction records and feeds them to the old system for updating. These updates are propagated to the parallel database via the conversion subsystem.

The major benefit of this approach is the increased productivity of on-line transaction processing. Most, if not all, of these benefits can be achieved without any changes to the logic of the

Adding business functions does not necessarily require that old systems be modified. Introducing new functions with new application architecture offers another approach.

Old and new systems can both update the integrated database; each would do so by "owning" different portions. The old system would own the original converted elements, and the new system would own the new elements and new tables.

There are several benefits to this approach. Although the overall database is being updated by two separate systems, it still presents an integrated, enterprisewide view of organizational data. This allows the old system to coexist freely with the new for the purpose of inquiry and reporting.

It also allows new development, even development involving data update functions, to be made in the strategic new system environment rather than the "throwaway" old system. This helps preserve the value of the development investment and eliminates the need to support new processing functions with both the old and new systems. It also prevents strategic development from being stymied during the lengthy effort required to

convert update functions from the old system.

Taking all these into consideration, the conversion project should be done in the following four phases:

Phase I: Database, inquiry and reporting conversion.
The first step is to reverse-engineer the old system's master files to third-normal form, adding data structures needed to

When You Buy DB2 S You Get A Lot More T

What's in the box is widely acclaimed as the most compre-

ProAlter/Plus lets you analyze and maintain all DB2

objects without SQL. It provides fully integrated

clone or revoke DB2 security; and invoke DB2 utilities.

ProEdit, the industry leader for complete DB2 application testing, includes integrated facilities to build a DB2 test environment (incorporating entity and referential integrity), manipulate DB2 test data, and test SQL code.

ProBuild enables you to build DB2 tools and application prototypes 50% faster. It's no

wonder that On-Line Software DB2 products are installed in more DB2 shops than any

other vendor. But as good as our DB2 software is, it's just the beginning. On-Line Software has been working with DB2 since its introduction and has developed an expertise beyond DB2 software solutions-to training and consulting.

> TRAINING SERVICES

Last year alone we trained more than 13,000 data processing professionals in DB2, CICS, and other technologies in courses ranging from "Relational Concepts and

support an enterprisewide data model.

Once this data structure has been defined to the data dictionary, the next step is to create load and maintenance programs to establish the initial "mirrorimage" database and to maintain it in parallel with the host master

In the best circumstances, the parallel database can be reloaded after every update of the old system. Usually, however, runtimes on a complete reload make this approach extremely impractical.

A more reasonable method is to compare the pre-update and post-update versions of the master files and trigger reconversion of only those accounts or items that actually changed.

Thus, completely reconvert-

ing these accounts or items is preferable to a mirror-image update because reconversion is simpler and helps guarantee synchronization between the master file and database.

The master file and database should periodically be reconciled, even daily, to ensure that the parallel database is not diverging from the master system's files. It may be necessary to create a comparison facility to track down differences on a record-by-record basis.

For the next step, open the new database to end-user computing using standard commercial packages. This procedure provides immediate benefits with essentially no effort on the part of applications programming staff.

After that, create an ad-

vanced on-line inquiry facility to fully use the new normalized data structures and database facilities. This facility is of particular value to customer service departments.

begin converting master-file reports to the database. This conversion can occur in parallel with all the remaining conversions and is less strategic than the inquiry conversion. This is because the process often merely replicates the reports the previous system was creating. (However, there is always opportunity to enhance the converted report to capitalize on the superior data availability of the modern database environment). • Phase II: Architecture, entry and editing conversion. This phase helps organizational staff process organizational data.

The first step is to create an application architecture to support overall processing functions. This architecture should consist of an on-line superstructure, on-line transactional drivers, off-line transactional drivers and nontransactional drivers.

The database encompasses the following specialized tables supporting processing: transaction tables, extract tables, pro-cessing option tables and program-recovery tables. application generation facilities of a 4GL often suffice for much of

MORE reasonable method is to compare the pre-update and postupdate versions of the master files and trigger reconversion of only those accounts or items that actually changed.

the on-line superstructure, al-though the remaining components now require development from scratch.

The next step is to use standard software engineering techniques, including computer-aided software engineering, to isolate logic needed to validate transactional functions. Priority should be given to the most strategic business functions. The source code of the old system can be of some benefit as a starting point. An analyst can isolate logic for a transaction by discarding all of the old system's overhead logic from the appropriate edit program. What is left is application policy for validating a particular business function.

Reworked validation logic is then plugged into standard slots in the architecture. It is often convenient to work the kinks out of the architecture by piloting a single transaction. After the pilot implementation is stable, remaining validation functions

CONSULTING SERVICES

We also provide complete

DB2 consulting which includes both technical and management aspects of DB2. Our consulting

services cover four major areas:

1. DB2 Value Added Services—where we provide DB2 physical data base design, installation, application programming, application performance tuning, system design and DB2 standards development.

2. Migration Serviceswhere we cover DB2 Installation and DBMS to DB2 Migrations.

3. Management Advisory Services—which include data analysis, data modeling, DB2 physical data base design, and system design.

4. Information Engineering/ CASE Serviceswhere we offer data analysis,

data modeling and DB2 system design.

Additionally, we can staff a DB2 project from individual programmers to full project teams.

CUSTOMIZED DB2 PACKAGE

We can provide a complete, customized DB2 package including DB2 software, education, and consulting services, so no matter what phase of DB2 operations you're in, we can help maximize the productivity of your DB2

personnel.

are converted into one subsystem (for example, a department) at a time.

At the conclusion of this phase, all inquiry, all database reporting and most user-perceptible aspects of on-line transaction processing have been converted. The old system still remains the master system.

 Phase III: Development of strategic new functions. Once a database and application architecture have been implemented, it is important to start using them to competitive advantage — even if the old system has not yet been replaced.

Indeed, at this point the pressure to complete the final conversion will have abated somewhat because the organization will already be enjoying most of the benefits of on-line processing. This lull

makes it easier to ensure that the final conversion of update functions is not rushed.

To further ensure that bread-and-butter processing is not disturbed by a rushed conversion, IS can delay the final conversion and address pressing strategic development issues.

Using the new database and architecture to support strategic development requires the addition or activation of new database elements and tables. Care must be taken to ensure that the conversion subsystem does not interfere with these new data structures.

Equal care is needed to ensure that the new system's logic does not interfere with data elements owned by the old system. These requirements limit new development to functions that are relatively independent of those supported by the old system. Many of the older systems have such enormous gaps in their support that this is sometimes not much of an impediment.

The processing logic components of new system functions are created by plugging edit and update modules into standard slots in the application architecture, developed during the on-line editing phase. This architecture is extended to encompass full-scale transactional and aging update functions.

 Phase IV: Basic update conversion.
 This phase is the final elimination of the old system by transferring its update logic into the new architecture to ensure maintainability. Data conversion issues are greatly reduced in this phase because most of the potential problems with the new data structure were dealt with in the inquiry and transaction editing phases.

However, IS may still need to perform one final data conversion upon implementation of update functions under the new system. As soon as this conversion is complete, data from the old system's master files are no longer brought over to the new system. Some organizations continue to run the old system in parallel for a time after switching update functions to the new system.

The old system's programs can be a good source for organizational update policy logic. The analyst isolates this logic by discarding overhead master-file access and editing logic. What remains is then fed into structured analysis.

The end result of the software engineering process is an update module that can be plugged into a standard slot in the application architecture. The architecture should not require modification to support this phase. All necessary architectural programming should have been completed by the end of the previous phase.

It is a good idea during Phase IV to try to preserve the overall business policy approaches supported by the old system. This reduces the complexity and increases the transparency of this conversion. If done properly, the Phase IV conversion can be invisible to users.

Phase V: Enhancement of converted functions. The final phase exploits the potential of modern technology to rework — rather than merely replicate — functions of the prior application.

If basic application functions were structured properly during previous phases, this phase can be accomplished by combining and reshuffling business processing functions rather than by developing new transactions from scratch.

In any case, only the application-specific processing functions that sit on top of the overall application architecture and database should require changing. Eliminating the need to touch the architecture or the database makes the final conversion much easier than with traditional, one-step conversions.

Architecturally based conversion is not without risk, however. Much depends on having highly capable application and database architects who can see the project through to completion. These architects must have authority on any issue affecting the software environment so that they are empowered to ensure its overall integrity.

Trying this approach without adequate staff is inviting disaster. The risk comes from the complexity that arises with the interaction among the logic of the old system, the conversion subsystem, new update subsystems and converted update subsystems.

The major difference in staffing between traditional and architectural approaches to conversion is that the latter can require the services of an architect for a longer period of time.

At the same time, the architectural approach is much more likely to succeed than the traditional approach, and it delivers benefits much earlier in the development cycle.

The rewards justify the project. Now, instead of listening to your staff, users or management howl about outdated systems, you can enjoy the sweet sound of seamlessly updated systems.

ON APRIL 27, SOME OF THE BRIGHTEST MINDS IN THE COMPUTER INDUSTRY ARE GOING TO GET FIRED.

Fired with questions at The Computer Museum's Second Annual Computer Bowl. The computer industry's best and brightest from East and West will take their battle positions in a mind-bending quiz game. It's designed to educate, stimulate, and just plain fire up the feisty competitive spirit of the industry's hottest in the ultimate computer challenge. Deady. Aim. Let the game begin. Delive at the World Trade Center, Boston, Massachusetts. Satellite broadcast to TECHMART, Santa Clara, California.

PostScript laser printers used to be expensive, large and shared by an entire office.

Until now.

microLaser from Texas Instruments: the affordable PostScript printer users can call their own.

Finally, for less than \$3,000 users can have a PostScript laser printer right at their desks. TI introduces its new microLaser, with the features users want — now and in the future.

Small size. Lots of value.

At only 13.4 inches wide and 14.2 inches deep, microLaser may be the small kid on the block, but it packs plenty of punch. This printer takes full advantage of powerful PC software. That's because it uses the Adobe® PostScript printer language and is compatible with the HP LaserJet® Series II — allowing the user to switch between them easily. With that kind

Because microLaser features the PostScript language, it prints fonts in a variety of type styles and sizes. Plus, it can print them tall-ways, long-ways, all kinds of ways. It even prints complex pages of integrated text and graphics.

Capabilities that grow as their needs grow.

One of the best things about microLaser is that users only buy what they need. So if they're not ready for PostScript language, they can buy the standard microLaser for less than \$2,000 and add PostScript software and other powerful features later.

Users can upgrade microLaser
without tools or technicians by
simply adding upgrade boards.

These boards include up to four I Mb increments of memory, serial and AppleTalk® interfaces and a PostScript interpreter. All they have to do to get additional fonts or emulations is plug optional microCartridges into two credit card-size slots.

Part of what makes microLaser a truly personal, desktop laser printer that takes up so little room is its paper drawer, which slides *inside*. Because microLaser holds 250 sheets standard (it holds 500 with an

optional paper drawer), users spend less time refilling paper and more time creating superb-looking documents.

The printer also handles a variety of

FREE! Adobe typefaces from TI.

What could be more affordable than that? When users purchase a TI microLaser with a PostScript interpreter, they get their choice of an Adobe Publishing Pack for their PC or Macintosh® (up to a \$475 retail value). Selected by publishing experts, each Pack features three high-quality Adobe typefaces proven to work well together in a specific application, such as newsletters, forms and schedules or presentations.

Not only that, they get an expertwritten "How To" booklet so they can get started quickly and easily.

started quickly and easily.
Call TI at 1-800-527-3500 for details!
This offer ends March 31,1990.

POSTSCRIPT

paper sizes and types — from letter, legal and executive to transparencies, labels and envelopes. For those times when users face a large mail merge task, they can just plug in an optional envelope feeder to easily alternate between letters and envelopes.

The affordable PostScript printer is a call away.

To find out more about how your users can have affordable PostScript printing right at their desks, call TI today. 1-800-527-3500.

of flexibility, the six-page-per-minute microLaser is ideal for word processing, spreadsheet and desktop publishing applications.

Reprints from Computerworld provide a valuable marketing/sales tool for your company!

Editorial articles are available as reprints and can be ordered in various quantities, and customized to include your company logo and sales offices. Whether you wish to have reprints of an article written specifically about your company or a subject of general interest, these reprints* can be a great resource for use in:

- Promotional/P.R. materials
 Internal meetings
 Company seminars
- * Produced in minimum quantities of 500 for black-and-white and two color reprints; 1,000 for four-color reprints.

Bells don't toll for you

In the grand scheme of the universe, six years is a mere blink.

The various divested chunks

of the old Bell Telephone System don't think so, though.
From the day that U.S. District Judge Harold H. Greene broke them apart in early 1984, they've been champing at the bit to get into some of the areas heretofore denied to them—chiefly, information services. Meanwhile, a host of competitors ranging from other telecommunications carriers to newspapers are waving signs that say "Never!"

With congressional hearings under way that may result in loosening the Baby Bells' bonds a bit, the natural temptation is to choose sides. In this case, that's extremely difficult to do because none of these jokers is dealing from an entirely pure deck. And make no mistake — the hands aren't being dealt with your benefit in mind.

Let's take the Bells. Their lament is simple: "This is unfair restraint of trade, and it's been going on long enough." Clearly, it's killing them to have to sit inside, grounded like defiant chil-

Going with globalization thrust

CEOs expect foreign competition to be driving force in high-tech's future

ANALYSIS

BY MITCH BETTS

Globalization will be more than just a buzzword in the 1990s. It will be the primary force that shapes the U.S. electronics and computer industries as companies increasingly look offshore for their competition, market opportunities and capital.

That was the sweeping conclusion of "Electronics 90: The New Competitive Priorities," a study released last week by the professional services firm Ernst & Young and Electronic Business magazine. The study was based on a survey of chief executive officers from 744 companies in the computer, software, communications, semiconductor and electronics sectors.

The survey found that more

than 30% of the CEOs expect that foreign companies will be their top competitors by mid-decade, compared with only 13% today.

Software scare

Even in the software industry—long dominated by the U.S.—executives are concerned about emerging competition from the Far East. "To the extent that there will be offshore competition, I expect it to come from Japan," said Jon A. Shirley, outgoing president of Microsoft Corp., in an interview published in the study.

While almost all of the CEOs considered the U.S. to be their primary market, most executives said they believe that foreign markets will become increasingly important in the next five years, the survey stated.

"Virtually every executive in

exposure," said Stephen E. Almassy, national director of Ernst & Young's computer industry services. The surveyed executives

The surveyed executives view Western Europe, Japan and the Pacific Rim as the key markets to exploit (see chart), but they are already finding foreign sales a challenging mission. While more than 60% of U.S.

Industry slump could spell user savings

ANALYSIS

BY MAURA J. HARRINGTON

If there is any truth to the adage that seeing is believing, then a Gartner Group, Inc. report issued last week should make believers out of a lot of people who were not convinced that the computer industry is in a slump.

Aggregate fourth-quarter 1989 revenue growth for U.S. information industry vendors

was down 5.7% compared with revenue growth in 1988, according to a study compiled by the Stamford, Conn.-based market research firm.

However, according to some analysts, the stalled fortunes of vendors could spell good fortune for users, who could enjoy at least the short-term advantage of heavy discounts on virtually everything, from software to microcomputers, minis and mainframes.

The numbers cited in the

Gartner Group report painted a grim picture of a slowing industry (see chart page 108). In addition to sobering year-to-year margin and sales comparisons in all major sectors, software revenue growth in the fourth quarter of 1989 wound down to a single-digit percentage increase — 6.2% — for the first time "in at least a decade," said Randall Brophy, senior research analyst at Gartner Group.

Similarly, revenue growth in the recently booming microcom-

puter market "went single-digit for the first time since 1986 in fourth quarter '89," he said.

fourth quarter '89," he said.

Conversely, coffers swelled in the niche markets in 1989, particularly among players such as Sun Microsystems, Inc., Tandem Computers, Inc., Oracle Systems Corp., Lotus Development Corp., Microsoft Corp. and Teradata Corp. Peripheral sales also grew, with Conner Peripherals and Quantum Corp. taking a large chunk of the market share with well-received new product entries, Brophy said.

IBM assails GSA 'foreign bias'

BY MITCH BETTS

WASHINGTON, D.C. - IBM has accused the U.S. General Services Adminis-tration (GSA) of "arbitrary, irrational and unlawful discrimination" for issuing a mainframe acquisition proposal that the firm says favors computers made in Japan and other foreign countries.

IBM's formal protest, filed March 8 with the GSA Board of Contract Appeals, said the offending procurement clause violates the spirit of the Buy American Act of 1933, which requires the government to give preference to U.S.-made goods.

on the case. Both sides will make their legal arguments at a Board of Contract Appeals hearing scheduled for April 6.

Matter of foreign components

The complaint concerns the GSA's 1991 mainframe schedule proposal, essentially an approved catalog for government purchases of mainframes. IBM said that some of its products, while manufactured in the U.S., cannot be certified as "domestic end products" under the current acquisition regulation because of the percentage of foreign components they contain. Unless changed, the contract regulation will classify some IBM products as foreign products subject to either 6% or 12% price surcharges on the GSA schedule, while products from Japan will be treated as domestic products, IBM said.

In essence, the IBM filing alleged that the GSA is using the wrong statutory test to determine what is a U.S.-made product. The GSA uses a provision in the Buy American Act that defines a product as domestic if the cost of its U.S.-made components exceeds 50% of the total cost.

IBM said the GSA should instead be using a test from the Trade Agreements Act of 1979, which focuses on whether the product has been "substantially transformed into a new and different article of commerce" in the U.S. IBM said the high dollar amount of the mainframe procurement requires the GSA to use the Trade Agreements Act test.

The Trade Agreements Act classifies Japan as a "designated country," the products of which are treated as though they were domestic. The irony, IBM said, is that the GSA is using the "substantially transformed" test for designated countries such as Japan but is using the tougher "50% component cost" test for defining domestic end products.

You bring money, we'll bring the tech

Texas Instruments, Inc. and Ja-pan-based Kobe Steel Ltd. are teaming up to make semiconductors — primarily based on CMOS technology — in Japan. Construction of a wafer fabrication plant in the Kansai region, estimated at \$350 million and intended as home base for newly minted joint venture company KTI Semiconductor Ltd., is scheduled to start in early 1991, with a late 1991 projected completion date. Under the agreement announced last week, Kobe will provide the lion's share of the start-up capital for KTI; TI will supply the manufacturing technology needed to create first the plant, then the chips.

Wizard deal

Electronic publishing player Adobe Systems, Inc. acquired its Moun-tain View, Calif., neighbor Emerald City Software last week; financial terms of the deal were not disclosed. Privately held, 3-year-old Emerald City makes typographic products and development tools based on Adobe's flagship product, the Postscript page-description lan-guage. All 15 employees of the start-up will join the Adobe roster.

Who's buying?

Not unexpectedly, software giant Computer Associates International, Inc. is. The Garden City, N.Y.-based firm plans to acquire Lisle, Ill.-based DBMS, Inc., an 11-year-old mainframe and microcomputer-based software development and maintenance tool maker.

Dodgers lineup Coral Gables, Fla.-based software vendor Bloc Development Corp. gained a new vice-president of technical development for its information management division last week. He's John P. Birch, who cut his technical teeth at IBM, directed advanced technology projects for ITT Corp. and from 1986 until now served as vice-president and chief technical officer at business software player McCormack & Dodge Corp., newly merged with Atlantabased Management Science America, Inc. into Dun & Bradstreet subsidiary D&B Software.

Where Do You Get The Most Comprehensive Information on Database Technologies?

Conference & Exposition July 17-19, 1990 • Santa Clara, CA

▲ 5 Track Conference Covering:

- ▲ IBM's SAA & DB2
- ▲ SQL Servers/Distributed Databases
- ▲ Object-Oriented
- **▲** Connectivity
- ▲ Distributed Database
- ▲ CASE & Repository
- ▲ OLTP & High Performance
- ▲ Text Retrieval Systems
- **▲** Expert Systems

▲ Keynote Speakers & Topics:

- ▲ Dr. George Schussel, Chairman The Hot Technologies & Architectures
- ▲ Dr. Michael Stonebraker The Interaction between SQL & Object-Oriented Databases
- ▲ Dr. Bruce Lindsay Object-Oriented Issues & Relational Technology
- ▲ Peter Pagé Object, SQL, & Network Databases -Can They Be Integrated?
- ▲ David Lima California's DMV Procurement: A Model for Government DBMS Benchmarks
- ▲ Plus More Than 25 Industry Experts

▲ Track Topics

- ▲ The CASE for Data Management
- The Future of ANSI SQL
- Advanced Techniques for Accessing Text Databases
- ▲ SQL Client Server and Product Comparisons ▲ SAA's Impact on IBM's Relational DBMSs
- ▲ The Role of Project Management & Estimating
- in Cross Life Cycle
- ▲ Cooperative Development: Easing the End-User Applications Development Headache
 ▲ Graphical Front-Ends for SQL Back-Ends
- ▲ Integrating Workshop Databases into the Corporation
 ▲ DB2 for Competitive Advantage Myth, Mayhem, or Mandate
- Future Directions for IBM Mainframes and Architecture
- ▲ On-Line Complex Processing (OLCP) as Compared to OLTP Applications
 CASE in the DB2 Environment

- ▲ Object-Oriented Analysis ▲ Comparing Relational, Text, and Document Management Systems
- ▲ Cooperative Processing

 ▲ The IRDS Standards: Interpretation and Forecast
- ▲ Software Management: Working with the Repository within AD/Cycle
- ▲ Rapid Prototyping: Database & Process Design with Expert Systems Technology

▲ DATABASE WORLD Exposition

▲ Features Leading Software Experts

Apple appeals for Air Force contract

BY JAMES DALY

RESTON, Va. - A simple misunderstanding caused a General Accounting Office (GAO) recommendation that could negate an important contract to supply the U.S. Air Force with tens of thousands of Macintosh II personal computers, according to Apple Computer, Inc. officials.

Key technical abilities of an Apple operating system were not well understood by the congressional investigative office when it ruled that the Mac does not offer the multitasking abilities called for in the five-year contract [CW, Feb. 12], Apple Federal Systems Group Director Greg Shuk said.

The GAO erroneously believed that the Macintosh Operating System, which offers no multitasking capabilities, is reguired to run Macintosh applications. Shuk said.

The Air Force had originally asked bidders for computers that could perform at least 10 tasks simultaneously.

However, the applications specified in the contract will run under Apple's Unix derivative A/UX, which allows multitasking, Shuk said. "Mac OS has no place in the configuration we're offering," he added.

Based on its misperception, the GAO then recommended that bidding be reopened on the contract, which originally had been hailed as a breakthrough in Apple's struggle to win acceptance in the lucrative government market, Shuk said.

Under the contract awarded

NTT breakup is postponed

TOKYO - Japan's Ministry of Posts and Telecommunications (MPT) has put off seeking legislation to separate the long-distance operation of Nippon Telegraph & Telephone Co. (NTT). Earlier this month, the MPT's advisory council recommended that NTT be split into three discrete companies [CW, March

One contemplated step, howthe partitioning of NTT's long-distance operation into a new subsidiary — relies on a change in the law regulating NTT. MPT postponed seeking the legislative change until fiscal 1994. That decision would in turn delay the three-way breakup of NTT.

Breaking off the cellular phone operation, which does not use NTT's existing telephone lines, will occur sooner, probably at the end of fiscal 1991

LORI VALIGRA

last August, Apple was to serve as a subcontractor under Honeywell Federal Systems, Inc. to supply at least 10,000 - and potentially as many as 80,000 -Macintoshes over several years, plus software and peripherals. Expectations of the potential value of the contract ran as high as \$600 million. The GAO decided to reopen bidding following a protest by Martin Marietta Corp., a losing bidder.

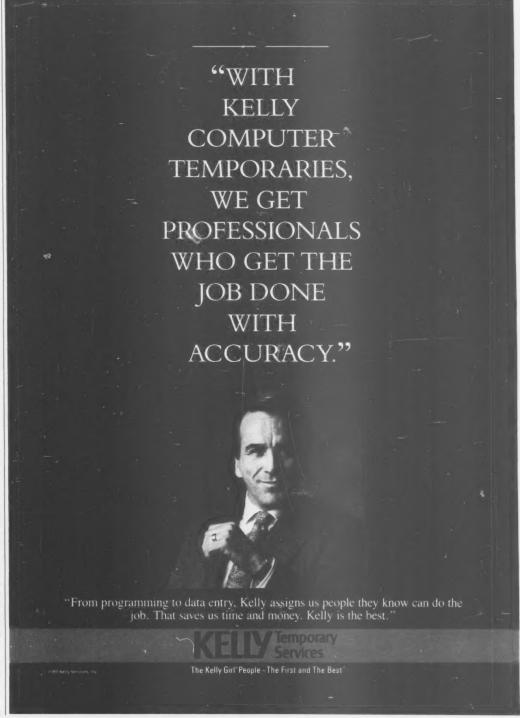

Heavy duty

Although the GAO's recommendation is not binding, it carries weight. "In the considerable

past five years, I can think of only one or two agencies that did not comply with our recommen-dations," said David said David Ashen, deputy assistant general counsel at the GAO.

However, Apple may have a big friend in the Air Force, which told the GAO that it would like to stick with the original Honeywell/Apple contract. Air Force officials said the cost of changing gears now could be as high as \$25 million. They have also offered to pay Martin Marietta's bid and proposal fees.

Apple officials said the GAO has 30 days to respond to the request for reconsideration, which was filed March 2.

Slump

CONTINUED FROM PAGE 105

"Those companies concentrating on niche markets such as fault tolerence, tape backup and other concentrated markets will continue to grow," Brophy added.

Mainframe and minicomputer 1989 net margins of 3.7% and 3.4% respectively marked an all-time low for both sectors, according to Brophy.

Part of the reason for an industrywide slump in margins for mainframes and minicomputers, Brophy said, was the heavy discounting that went on in 1989 — spurred, according to some analysts, by IBM's former marketing strategy, which resulted in favoring its major accounts with bigger discounts for some of IBM's bigger sales.

Strategy switch

Those days are gone, however. IBM's new marketing strategy, put into effect in January, rewards sales managers for both revenue and gross profits generated rather than just revenue — a distinct disincentive to discount.

End users were also to blame for margin shrinkage last year, according to Bob Djurdjevic, president of Annex Research, a market research firm in Phoenix. Users who received, for example, a 40% discount on a full, multiyear package deal from IBM would turn to smaller mainframe vendors and demand more than 40% discounts for the mainframe alone,

Industry slouch

Net margins and revenues for the past three years illustrate the current industry slump

Djurdjevic said.

"[The new IBM marketing strategy] will force them to think and act more like businesspeople not just salespeople," Diurdievic said.

Globalization

CONTINUED FROM PAGE 105

electronics firms have sought to establish sales in Japan, nearly one-third have failed, according to the survey.

Not surprisingly, 50% of the CEOs believed that their success or failure in the Japanese market depends on the U.S. government's ability to negotiate a favorable trade agreement with Japan, the study said.

James G. Treybig, president and CEO of Tandem Computers, Inc., is looking at the prospect of a unified German market. "If the West Germans go into East Germany, then I think that will be a good market — about a 20% bigger market than West Germany alone," he said in the study.

G. Steven Burrill, national director of Ernst & Young's high-technology industry services, said the survey "demonstrates unequivocally that corporate leaders in high technology no longer think in terms of domestic markets or domestic technology developments."

U.S. industry will increasingly look upon foreign countries as sources of capital, the study added. Today, 16% of the industry relies on foreign funds; that is expected to increase to 27% over the next five years, it said.

Meanwhile, the industry seems to have a love/hate relationship with Wall Street. The CEOs said they expect to increasingly tap the public equity markets as their primary source of capital, but 76% complained that Wall Street's shortterm, quarterly perspective is holding back the industry's long-term growth. In the study, Ashton-Tate Corp. Chair-

In the study, Ashton-Tate Corp. Chairman and CEO Edward M. Esber Jr. called the quarterly reporting requirements "a very frustrating scenario" for the software business. "In the end, it's the investor and the customer who suffer when companies decide not to invest in upgrading a popular product or developing a new, advanced technology because of the effects on the short-term revenue stream," he said.

High-tech trends

In addition to globalization, the study identified the following trends for the high-tech industries during the 1990s:

 Seventy percent of the CEOs named customer service as a top area of focus for their companies in the coming five years.

 More than 86% of the industry CEOs expect strategic alliances to play an "extremely important" role in their companies' business strategies over the next five years.

 Half of the CEOs expect their own companies to be acquired or merged in the next five years.

 No consensus developed about what role the U.S. government should play in boosting the competitiveness of high-tech industries.

 The possibility of a recession is by far the most serious economic concern of all electronics companies. The second biggest economic issue was the federal budget deficit.

St. John

CONTINUED FROM PAGE 105

dren while everybody else is having a great time outside playing.

Well, I bieed for the Bells. The various holding and operating companies were part of a structure that, for nearly a century, was the monolith of U.S. business, enjoying a lack of competition that

other companies would have killed for. One of their main arguments is that the market is hampered by their inability to release cutting-edge technologies or information that would increase users' efficiency.

To some extent, they've got a beef there; witness the way the Federal Communications Commission put Southwestern Bell on hold while waiting for permission to give listings to AT&T for a national on-line directory. And that's small potatoes compared with the effect the Bells' pent-up energy could have on the entire market.

Right now, there's legislation pending that would let up on the Bells a bit but still bar them from information services. Indications are that they think it's not enough; an even more lenient measure is being drafted that would take the bonds off totally. The result will probably be

that neither passes, and for the moment that may be best; opponents say the rest of the market would suffer in the long term from the Bells' strong presence, and they may well be right.

Does all this mean the opposition is any more correct? I'd say not. Opposition from long-distance carriers — including, ironically, AT&T — is only to be expected, given their desire to keep the Baby Bells off their necks for as long as possible. That's sound business; what it isn't is an altruistic motive for restraining business for the good of the people, the country, or anyone other than AT&T, MCI, Sprint and the rest of the competitive carriers.

Even more laughable is the opposition from newspaper publishers, who claim they'll never be able to get a foothold in the information services market in the face of a market assault by the Bells. All that means is that the empire-building of the chains — the only ones who could afford to enter the market — will be slowed somewhat. I doubt any of them are going to have too much of a struggle jumping into information services, unless they run their shows the way Knight-Ridder ran its ill-fated Viewdata project a few years back.

So why are these hearings being held? Well, some honorable members of our Congress think it's time some wrongs were righted. Rep. John Dingell (D-Mich.) says Congress and the FCC ought to have oversight of the market instead of Greene. This, folks, is a turf battle, plain and simple. In fact, what we have here is self-interest all around. Until any one of these parties can explain what's in it for users, perhaps we should turn a deaf ear to all of them.

"...Based on number of leads per dollar invested, I always win with Computerworld Response Cards."

> — Paul D. Boone President Stile Software Company

Paul D. Boone, President of Stile Software Company, distributes OUTBOUND, an amazing new file transfer system developed by Firesign Computer Company of San Francisco. His start-up company, based in Orford, New Hampshire, is relying on *Computerworld* Direct Response Cards to help expand its customer base throughout the

United States and Canada.

"OUTBOUND" is unique in that it transfers files directly between PCs and a mainframe in one easy step, without having to depend on or even involve the end users.

Since it's initiated and controlled by the mainframe, files can be transferred at any time - day or night. In fact, as long as the PC is turned on, can communicate with the host, and is running OUTBOUND under MS-DOS. OUTBOUND can go right to work. It's so productive that it even lets the end users run other applications on their PCs while the host is transferring data back and forth. The central site can transport files to and from the users without having the end users do anything. It just can't get any easier than that.

"Now it's my job to show potential buyers what this 'ultimate user-friendly' system can do for them. Specifically, I'm targeting applications development managers and info center managers in larger companies with distributed computing environments. My goal is to get the OUTBOUND message out to lots of people quickly, easily, and economically. So I chose Computerworld Response Cards.

"And it was the right choice. I was extremely impressed with the number of inquiries I received very quickly — calls actually started coming in the very first day. My advertisement in the August Computerworld Response Card deck alone generated over 300 good leads. In following up, I've already installed a number of OUT-BOUND systems under our 30-day "No Hassle" Free Trial Program. And that's good news for me, since typically 80% of all OUTBOUND trials result in sales.

"Converting leads into sales — economically — is the backbone of my business. Here, based on cost per reader and number of leads per dollar invested, I always win with Computerworld Response Cards. And to keep on winning next year, I plan to double my frequency schedule in Computerworld Response Card decks."

Computerworld Direct Response Cards give you a cost-effective way to reach Computerworld's powerful buying audience of over 133,000 computer professionals. Every month. Call Norma Tamburrino, National Account Manager, Computerworld Direct Response Cards, at (201) 587-0090, or (201) 587-0297 to reserve your space today.

Two cheers for Hollywood

In movie making, IS people experience more pressure than glamour

BY DAVID A. LUDLUM

nformation systems professionals in the movie industry can't expect to do power lunches with Stephen Spielberg or dine with Meryl Streep. John Granaghan, vice-president of MIS at Orion Pictures Corp., says he sees more famous people on the streets of New York than on the inh

Even if they don't join in the glamour, however, IS people get their share of pressure, according to executives and consultants. The pace is frenetic because the business is driven by deals — deals for individual projects and, given the stiff competition and high financial stakes, deals for new top management.

These deals are often negotiated in secret, then suddenly announced to the world. Furthermore, a movie deal doesn't bring even short-term stability; performers and other "creative" professionals prompt frequent changes in projects, sometimes even cancelling them.

New management usually means a new strategy and structure — things that can also change quickly without a new face at the top. Two years ago, for example, studios could barely supply enough programming for syndicated television. Now the demand has dried up. The catchphrase is "What have you done for me lately?" says Jerry Mayfield, a vice-president at DMW Group, an IS consulting firm in Stamford, Conn.

Given the pace, lead times for getting systems up and running can be much shorter in the movie industry than in oth-

er industries, and "crunch mode" is another common expression, says an IS executive at a major studio in Los Angeles.

As a result, systems analysts need to know business needs thoroughly, executives say. Since analysts may do analyses while colleagues design, IS people also need a collaborative spirit and strong communication skills.

Communication with users can pose special demands as well. IS people are often careful, deliberate and detail-oriented, while movie industry users tend to be more spontaneous, "almost like the yuppie crew on Wall Street," Mayfield says.

Love IS or hate IS

The users tend to be enthusiastic about technology; it plays a leading role in some productions. But personality conflicts can lead users into a love-hate relationship

with IS organizations, Mayfield says. "They want the technology, but you've got to be able to deal with them on their terms."

IS people won't join the stars in inking megabuck contracts, but they do get compensated for working in a high-pressure environment. It's not unusual for sys-

tems analysts to make more than \$60,000 per year and for programmers to bring in more than \$40,000, consultants and executives

The industry offers growth potential, too.

There were record sales of movie tickets last year, and studios are generating additional revenue through videocassettes, television and international dis-

tribution.

Development of new systems should be a particularly strong growth area as companies launch new ventures. At one company, the home video business has grown from zero to \$650 million in five years, says Victor Janulaitis, chief executive of Positive Support Review, Inc., a Los Angeles consulting firm. That growth required the development of systems for jobs such as tracking orders, controlling inventory and forecasting demand.

Today, most companies are exploring the studio tour busi-

DB2/CSP/CICS

DATRONICS

ness, and in the future, many of them will put films on laser disc, creating the need for new procurement and distribution systems, Janulaitis says. Some of these systems will employ electronic data interchange, he adds.

Like other industries, the movie business needs programmers, but these people tend to be readily available. Companies have a more difficult time finding analysts and project managers who have movie industry experi-

Another big need is for specialists in personal computers and local-area networks, which Movie companies also need people who understand finance, executives say. They value IS professionals with some academic training in this area, previous work at a major accounting firm or some experience at solving complex financial problems, according to John Sanders, vice-president of MIS at MGM/UA Communications Co. in Culver City, Calif.

Movie companies must monitor budgets closely and run complex financial applications unique to the industry. One application is tracking residual payments for the re-release of movies and

ODAY, MOST COMPANIES are exploring the studio tour business, and in the future, many of them will put films on laser disc, creating the need for new procurement and distribution systems.

movie companies use at production sites. There, workers use PCs to track spending and working hours, monitor budgets and run payrolls for day workers. Others also use the technology; animators and music composers do some of their work on PCs, and writers use them to revise scripts while a movie is being shot.

The movie industry's strong project orientation makes consultants popular; studios often need IS people when they begin production of a new film, TV show or commercial.

television reruns, seeing that the right people get paid the proper amounts. Another is tracking ticket receipts: Movie companies collect a percentage of ticket prices on a sliding scale that changes as movies continue to run.

If an IS person can't maintain control of this kind of application, top managers will tell him they can't afford to keep him around, Janulaitis says: "There's too much money at risk."

Ludlum is a Computerworld senior writer.

Join Our **Aggressive Applications Development & Operations Support**

CAROLINA POWER & LIGHT COMPANY, a major force in Southeastern power generation and distribution, offers information systems professionals the kind of environment that will provide long term professional and personal satisfaction—the latest in proven technology and an appealing lifestyle. We're looking for data processing professionals to join our team and provide aggressive applications development and operations support.

Along with wide use of personal computers, we're operating one IBM 3090-300, one IBM 3090-200, and one Amdahl 5890-300. The CICS on-line environment has been growing at the rate of 40% per year. Recently, we have expanded to a new Data Center. We're operating under MVs; XA and VM; CXB utilizing an SNA/SDLC network consisting of over 3,000 terminals and printers. Our programming languages are COBOL, SQL and DATACOM's IDEAL. We have adopted DB-2 as our standard for new application development and are aggressively expanding our use of PC-based and mainframe-based CASE toxols.

We have recently completed a large strategic planning study and have a significant backlog of technical and application development projects. We are currently seeking the following:

APPLICATIONS DEVELOPMENT

Programmers

Positions require 4+ years of structured coding experience. Highly desired experience would include COBOL, CICS, DB2 and DATACOM. A four year degree is preferred.

Systems Analysts

Positions require 4+ years experience in a development environment versus a maintenance environment. Highly desired experience would include structured design techniques, data modeling experience, prototyping and Method/1 knowledge. A four year degree is preferred.

DATA ANALYST

Position requires 4+ years experience in data administration, database administration, or systems development. At least 1-2 years experience in logical or conceptual data modeling is also required, as well as experience with CASE tools. Excellent interpersonal and communication skills are essential, and JAD facilitation skills are highly desirable. Some task or project management experience is also desirable. A four year degree is preferred.

DATABASE ANALYST

Position requires 4+ years experience utilizing a relational database engine, preferably DB2 or DATA-COM/DB. Desirable experience includes formal participation in the physical DB design activity of devel-opment projects. A four-year degree is preferred.

SR. DATA COMMUNICATIONS ANALYST

Position requires 5+ years experience in data communications in a large systems SNA environment. Knowledge of PC Local Area Networks desirable. Excellent written and oral presentation skills, as well as project management and planning experience, are a must. A four-year degree is preferred.

LAN SUPPORT ANALYST

Requires 3-5 years of technical experience in personal computer support, including a minimum of 1-2 years in the design, implementation and support of Local Area Networks, preferably in a LAN-to-LAN or wide area connectivity environment. Banyan network operating system experience strongly desired. Candidates must possess strong verbal and written communication and client consulting skills. A four-year degree is preferred.

SR. INFORMATION CENTER ANALYST

Requires 5+ years of technical experience in supporting PC software and hardware products such as spreadsheets, databases, and communication. Experience in the support of Local Area Networks, preferably with the Banyan operating system, is strongly desired. Excellent client consulting and project management skills and strong verbal and written communication skills are a must. A four-year degree is preferred.

. The quality of life in the beautiful Carolinas is one on which to boast. "Our advertising in Computerworld's Classified Marketplace more than pays for itself."

 Mark Ostroff President & Partner Compurex Systems, Inc.

Headquartered in the Boston area, Compurex Systems is a distributor of new and reconditioned IBM and Digital equipment. With a product line that includes everything from systems and disk drives to printers and other peripherals, it has a lot to offer large end users. President Mark, "Rocky" Ostroff, along with his two partners, Christopher Pernock and Jack Malamut, face the challenge of finding everyone who has something to sell or is looking to buy. When it comes to advertising, they're on the right track.

"We need to get the Compurex name out to a broad base of prospects in a variety of industries. And we need to tell them about all of our programs — buying, selling, trading, leasing, and consignments. We believe that most people who buy/sell concentrate on the classified section. It's where they look first. For us, Computerworld's Classified Marketplace is where our message gets delivered to the largest and most diverse audience of potential customers.

"Since we founded Compurex Systems in 1986, sales have doubled each year. To maintain this momentum, it's critical for us to continue generating quality leads. Our weekly ad in Computerworld's Classified Marketplace keeps a steady stream of calls coming in — even international calls. Based on these results, our advertising in Computerworld's Classified Marketplace more than pays for itself.

"In early 1990 we'll be moving our expanding business to larger quarters — from Stoughton just up the road to Easton. But one thing won't change: our weekly advertising schedule in Computerworld's Classified Marketplace. That's where we'll stay to keep the calls coming in."

Computerworld's Classified Marketplace. It's where computer buyers meet computer sellers. Every week. Sellers and buyers like Compurex Systems who advertise in Computerworld's Classified Marketplace because it reaches over 612,000 information systems professionals. And because it works. To put your classified message into the hands of America's most powerful audience of buyers, call John Corrigan, Classified Advertising Director, at 800/343-6474 (in MA, 508/879-0700).

Leasing in the '90s: A new look

Business strategies and technological change are factors in the decision

BY MICHAEL ERBSCHLOE

f you are deciding whether to lease or buy computer systems, there is more to think about than the traditional financial trade-offs. In today's business environment, you need to consider the longrange plans of your business unit or venture. You also need to take into account the pace of technological advances. Both of these concerns may be more important than the components of conventional financial analysis.

Companies that did well in the 1980s were creative, intelligent and market-oriented. The ones that will do well in the 1990s will be fast, flexible and flush with cash or ready credit to take advantage of market opportunities. Leasing computer systems can help keep a business lean, with less money invested and more cash available.

Leasing can also enhance the flexibility that companies will need to respond to the quickening pace of technological change.

Leasing computer equipment can still provide the following traditional benefits:

• Prevent you from getting stuck with obsolete equipment.

Free up capital for other uses.

· Improve your cash position by spreading costs over a period of

 Stabilize earnings and net worth by minimizing peaks and valleys in income caused by large capital expenditures.

• Reduce the potential for losses when replacing equipment that has not been fully depreciated.

 Allow custom-tailoring of contract terms, such as the timing and amount of payments and conditions for buying or subleasing equip-

With the business environment becoming more competitive, there can be other benefits. Leasing can help minimize investments in business units that might be sold or spun off, increasing the potential profit of such moves.

Leasing can also reduce the number of managers and staff members needed to acquire or dispose of equipment. This concern is becoming more important as companies try to hold staff levels to a minimum. It is especially relevant when an organization's capital spending procedures require involved cost justification or other time-consuming measures.

The pace of technological change also influences the decision to lease or buy in several ways. New technology is coming to market every 12 to 18 months, which is devastating the residual value of installed equipment. By keeping the value of

computers off the balance sheet, leasing can help reduce the impact of plunging residual values. This is particularly true with technologies undergoing rapid advancement, such as workstations and highend servers.

The shortened product cycles also make it more difficult to sell used equipment, which suffers from increasingly poor price/ performance levels. Leasing can eliminate the need to face this challenge.

Finally, leasing can make it easier to test new technology or systems from vendors with which you don't presently do business. You might want to conduct such tests in an individual business unit or on a particular application without disrupting your mainstream operations. This tactic is becoming more important and more prudent to assure that your company does not get stuck with a platform that is

antiquated or discontinued.

Although these factors are making leasing more attractive for some companies, there are still many situations in which it is not the best alternative.

Leasing may not be desirable if your company can benefit from the depreciation allowed on pur-

More companies expect IS managers to participate in business planning and decision-making. Other companies want IS managers to at least possess a better understanding of the impact of computer acquisitions on the organization's financial health and flexibility.

EASING CAN HELP minimize investments in business units that might be sold or spun off.

chased equipment.

Leasing will not be the least expensive alternative if the equipment you are acquiring will be an integral part of your major architecture and if you will be using it over a long period of time. By leasing for five years or more - a typical life span for a large mainframe - you will end up paying more than you would by purchasing a system.

If a lease will in any way diminish the control that you need to maintain — restricting where you can move a system, for example - purchasing is your best alternative.

If a lessor requires you to buy maintenance services that are not consistent with your maintenance strategy, it may cost you more to lease than to buy.

In most companies, the roles that information systems managers play have expanded well beyond that of technologist.

A sharp IS manager can turn the difficulties that arise in acquiring and disposing of systems to his advantage. If he can show his firm how to meet its computing needs and minimize current and long-term costs, he may find his bosses very appreciative.

Erbschloe is executive editor at Computer Economics, Inc. in Carlsbad, Calif.

TRAINING

JAD sessions: Setting the tone

Training managers are the lead players in Joint Application Design

BY MARK DUNCAN

oint is the operative word in joint application design, or JAD, which supports the trend in recent years toward pulling together the parties responsible for designing application software.

The information systems manager faced with delivering training for the introduction of JAD must understand the roles and responsibilities of the participants as well as the mechanics of the JAD session.

When an organization first embarks on JAD, it would do well to arrange professional training for the participants, especially for the facilitator. Many companies already offer such training.

When JAD becomes an accepted technique and facilitators get some experience under their belts, they may take on the responsibility for grooming new participants. The training manager's first job will be identifying prospective participants, which calls for knowing what to do. The major players are the following:

The facilitator. JAD participants come from different parts of the organization and hold different ranks, but within the JAD session, everyone is considered equal. It is up to the facilitator to maintain an atmosphere free of hostility or intimidation.

Good candidates for the role of facilitator must be able to lead people who are from different parts of the organization and of mixed rank. They must control a

meeting, keeping it on track while permitting legitimate digressions. They must draw everyone into the session and be persistent in working toward con-

The executive

sponsor. Though they play a minimal role in terms of attendance, executive sponsors are crucial in providing support and commitment. The training manager must make them aware that it is their responsibility to create and sustain the momentum of JAD. Their appearance at kickoff sessions is essential to charge

the team with a purpose and to motivate it with encouragement and respect.

The user. Users fortunate enough to work in a progressive IS department will probably have little difficulty adapting to JAD, since they already serve as key players in system development. JAD will simply be a logical, formal extension to existing practices. Users who've been excluded from heavy participation may

require more encouragement.

The system developers. Similarly, some system developers may find it hard to accept users and other people as equal participants in development. The

following statistic can provide one selling point for trainers: The largest percentage of software errors, and the ones most difficult to correct, arise in the early phases of requirements and design. Developers should see that user participation means sharing the responsibility for accuracy in requirements - and more than likely a reduction in these errors.

The scribe. This is typically a technical person from the development staff. The scribe must, however, be familiar enough with user terminology to capture and represent a requirement or design feature on the tool being used in the JAD ses-

Specialists. Specialists attend JAD sessions on demand. Their role is to provide expert information on aspects of the business or the means of automating functions.

The rules governing the JAD session are simple and straightforward. At first, the facilitator must enforce them fairly and consistently. After participants become familiar with JAD, they might take on more of this role.

The key rules and procedures the trainer must convey to the participants are:

 Every participant participates! Occasionally, nonparticipating observers will be present, but otherwise, there are no passengers in a JAD session.

• Participation is full-time. Poor sporadic attendance will weaken JAD; a group of people working closely together toward a common goal generate momentum and synergy.

• One speaker at a time. The fa-

cilitator must guard against side conversations in which some participants exchange comments to the exclusion of others.

• No interruptions. If necessary, the facilitator may limit a speaker who appears intent on consuming an unfair amount of time to make a point or has digressed far from the issue.

• The facilitator controls the agenda. He keeps the session on track; though the agenda may have been created jointly, it is one of the facilitator's jobs to ensure that it is honored.

Reach a consensus. On those occasions when a consensus proves elusive, the facilitator may pursue one of several alternatives. He may request that specialists attend the session or request a subsequent session when participants return with fresh energy and ideas.

· Sessions are user-driven. The most important purpose of JAD is to identify and capture complete and accurate user requirements. It is the users, therefore, who should do most of the talking by stating facts and describing business functions. The IS people should ask the appropriate questions to solidify those facts and functions.

Duncan is a quality assurance consultant at a large Dallas bank.

Low motion

Technology firms dip, pivot as investors drum up profits

How low can you go? Technology stocks limboed lower and lower last week as investors danced to the profit-taking beat.

Among those hit by the old soft-shoe was Oracle Systems Corp., which saw its shares dip to 24% on Thursday, down 1% points. Also on the downside was Microsoft Corp. After reaching a new 52-week high early in the week, the No. 1 software maker lost 2% points by Thursday to finish at 111%. The party was also over for Adobe Systems, Inc. as shares stumbled 4% points to 39%.

A few firms managed some fancy footwork, though, including Digital Equipment Corp., whose stock stepped up 2 points to 79½. Hewlett-Packard Co. whistled a happy tune as well, gaining 1½ points to 46% after its announcement that New Wave stands for a hearty hello to industry standards as well as the name of its software. Ashton-Tate Corp. wiggled up ¾ of a point to close Thursday at 13½. Monday's introduction of a new highend Macintosh by Apple Computer, Inc. may have helped hustle stock prices up ½ of a point to 40¾. However, the unveiling of a new line of laser printers with Okidata Corp. did not seem to put any pep in IBM's step; its stock slipped 2½ points to 106½.

CDC executive to join Commerce?

President Bush said last week that he will nominate Robert Marshall White to be undersecretary of commerce for technology, a new position. White, 51, has served as Control Data Corp.'s chief technical officer and vice-president for research and engineering since 1986. Earlier in his career, he held senior technical positions at Xerox Corp. White has taught or conducted research at Cambridge University, Stanford University, the University of California at Berkeley and Osaka

Test-Piloting in Unix

Pilot Executive Software is about to begin beta testing an executive information system (EIS) that will operate under the Unix operating system. The company said its EIS development environment and its suite of EIS templates, including the EIS/G series of code-generating applications, will run on Hew-lett-Packard Co.'s HP 9000 Series 800 computers under the HP/UX environment. HP/UX is compliant with AT&T's industry-standard Unix System V. The move will give Pilot the first major EIS to run under Unix, the company claimed. A spokesman for Pilot said the Unix EIS will be commercially available by late May or early June.

Agway takes on Hood processing Citing cost savings and convenience, H.P. Hood, Inc., a Bostonbased dairy, citrus and food manufacturer, has moved all mainframe processing functions to Agway, Inc. in Syracuse, N.Y. Agway's Data Services division will handle data processing for Hood while the latter decentralizes its operations, a process estimated to take three years. Hood is moving to an IBM Application System/400 computing environment.

Vitalink to route more protocols

Vitalink Communications Corp. will incorporate Touch Communications' Open Systems Interconnect (OSI) software in its Transpath bridges and routers in 1991 under an agreement signed last week. This is reportedly the first time Touch, which generally provides OSI-based products to systems integrators and large end users, has provided an internetworking company with its implementation of the OSI protocol stack. Vitalink also announced that, in addition to including OSI routing in its Transpath line, it will add routing for Digital Equipment Corp. Decnet, Government OSI Profile and Xerox Network Services protocols and will develop an X.25 network interface.

Florida State buys supercomputer

The Supercomputer Computations Research Institute (SCRI) at Florida State University has a new addition: a \$7 million-plus Thinking Machines Corp. Connection Machine R system. The configuration of the supercomputer, which is now up and running, includes 65,536 parallel processors and 2G bytes of main memory. SCRI, established in 1984 with U.S. Department of Energy support, conducts research programs in high-energy physics, geosciences and materials science. Florida State also recently added a Cray Research, Inc. supercomputer to replace an ETA Systems, Inc. box.

Soft-Switch opens gateways

Soft-Switch, Inc. announced new X.400 gateways last week and said they support exchange of binary files and revisable files such as word processing documents over X.400-based networks. The Wayne, Pa.-based maker of electronic mail products said the ability to transmit binary files over X.400 nets is based on technical recommendations made by the National Institute of Standards and Technology (NIST), formerly the National Bureau of Standards. Soft-Switch said that U.S. Sprint's Sprintmail Service also follows the NIST recommendations and that the two companies hope to see the NIST approach adopted as an industry standard. Other companies expressing support include AT&T, General Electric Co. and Western Union Corp., Soft-Switch said.

Can RS/6000 outshine supers?

BY JAMES DALY

LIVERMORE, Calif. new kid on the block in the workstation market has already started a shoving match.

Performance tests recently conducted by a computer re-searcher on IBM's fledgling RISC System/6000 workstation line indicate that the new system is faster than a Cray Research, Inc. supercomputer on specific scientific tests, opening a hornet's nest of debate on the future of high-performance computing.

University of California Lawrence Livermore National Laboratory researcher Eugene Brooks raised serious questions about the impending role of conventional supercomputers when he reported that IBM's Powerstation 530 performed up to 50% faster than a Cray Model X/MP 4/16 when running a pair of scalar processing applications. Scalar processing, a computational method in which numbers are processed one at a time, is typically found in applications such as operating systems.

The show for scalar perfor-

a first-class killer micro," said the researcher in comparing the \$42,705 IBM machine with the \$4 million Cray box. "IBM is delivering the same performance [as the Cray] at one one-hundredth the cost.

The RS/6000, which is scheduled to be available in May, is the first workstation built to a superscalar execution design, which permits the execution of as many as five instructions simultaneously. The model can also process 34.5 million instructions per second.

While Cray officials conceded that there was pressure in the scalar area, they said scalar tasks take up less than 1% of the Cray's processing demands. Benchmarking Manager of Charles Grassl said its machines derive their computational punch from vector processing, in which a single instruction is simultaneously executed on a list of numbers.

Such processing is frequently needed for problems that involve extremely long sets of calculations, such as computational fluid

Brooks conceded that a vector processing test run at his laboratory between the two machines showed the Cray firmly in the lead.

Early indications of an impending narrowing of differences between the two product lines could have enormous implications for users and could further spur sales in the already sizzling Unix workstation market.

Observers said workstations are overtaking the performance of minicomputers and will continue their kudzu-like power creep into mainframe territory within the next few years.

Analysts warned, however, not to count out the supercomputer yet.

"We have at least a decade in front of us in which supercomputers will have a vital role to said Omri Serlin, a Los Alplay." tos, Calif.-based consultant and editor of the monthy "Serlin Report on Parallel Processing" in-dustry newsletter. "But the advances in the performance level of micros has been quite as-tounding."

DG hustles to hold on to 6,000-unit fed deal

BY MARYFRAN JOHNSON

WESTBORO, Mass. General Corp. climbed back into the ring swinging last week after a federal agency derailed the largest government contract award in the firm's history.

In what a rival vendor called a "grandstand play to impress their stockholders," DG filed a notice of appeal asking the U.S. Court of Appeals in Washington, D.C., to overturn a ruling by the General Services Administra-

That ruling, by a GSA appeals board on March 15, upheld an SMS Data Products Group, Inc. protest against the awarding of the bid.

The disputed contract is for a nationwide computer network for the Department of the Interior, which is to be used mainly by the water resources division of the U.S. Geological Service. The Distributed Information System (DIS-II) network was to include more than 6.000 Aviion workstations and servers and could be worth up to \$127 million over the next seven years.

"This contract belongs to us. We were improperly removed," said Bert Rosecan, president of SMS, a systems integration company offering Hewlett-Packard Co. workstations for the net-

In its ruling in favor of SMS' protest, the GSA board agreed that the McLean, Va., vendor had been improperly disqualified from the project.
With the federal court now in-

volved, the interior department began last Friday to terminate DG's contract and reopen bidding for the "best and final offers" of the three finalists, federal contract negotiator Ronne Rogin said.

The three finalists are DG. SMS Data Products and Lockheed Corp.

Although the government is authorized to spend as much as \$127 million, the actual bid awarded to DG was in the \$60 million range, Rogin confirmed. The SMS bid was the lowest of the three, she said, but she added that the company "didn't meet our requirements" when it came to software licensing.

The central point of contention is whether the software licensing should be unlimited or sold on a per-user basis.

"We don't know the number of users we will have, so although it's probably cheaper to [purchase licenses for each user], what we need is unlimited licensing," Rogin explained.

The contract negotiator said the government was also con-cerned that depite SMS' low bid, additional costs would be incurred in upgrading the older HP workstations that SMS proposed to use. "Their price might evaluate low but not end up being the lowest price," Rogin said.

The success of the Aviion line, DG's first set of reduced instruction set computing machines, is crucial to the company's future as it shifts away from its proprietary platform of Eclipse MV minicomputers to the Unix-based Aviion line.

The interior department's water resources division is replacing a network of Prime Computer. Inc. minicomputers and intends to use the new network for office automation, electronic publishing, geographic information systems and hydrologic ap-

"The Aviions are a good solid product, so it's not like the bid wasn't any good," said David Card, an industry analyst at In-ternational Data Corp. in Framingham, Mass.

This contract was important to DG in many regards, he added: "Not only was it a big contract to win, but it set DG in motion to bid for big federal Unix contracts.

IDC estimates that DG sold 700 to 800 Aviions — mainly workstations — in 1989, the product's first full shipping year. That amounts to \$20 million to \$30 million in Aviion business. Card said

Internet interloper targets hacker critics

BY MICHAEL ALEXANDER

It was high noon on the Internet computer network last week as an unidentified hacker with a 'gunslinger mentality' set out to confront those who have castigated outlaw hackers for illegally breaking into computers.

The hacker successfully pen-

etrated systems at Harvard University, Purdue University and Digital Equip ment Corp. and attempted to enter several dozen others on the nationwide network, which links computers at research labs, universities and other sites.

'It is somebody with a gunslinger

mentality out to prove who has the fastest gun," said Clifford Stoll, an astronomer at Harvard's Smithsonian Center for Astrophysics.

Purdue's

Spafford

network.

The hacker also managed to penetrate a computer account belonging to Eugene Spafford, an assistant computer science professor at Purdue University noted for his research on computer worms and viruses

"He is not a novice but a known, professional computer criminal," Spafford said. The Spafford said. The hacker, apparently an Australian named Dave, is well known within computer and telecommunications security circles.

"There are aspects of the case that I have a legal obligation

not to talk about because there may be a federal grand jury investigation and a tri-Spafford said. He added that the notified university federal law enforcement officers immediately after the first break-in was discovered.

rently under investigation. The trespasser accessed a Sun Microsystems, Inc. workstation at Los Alamos National Laboratory in Los Alamos, N.M., and used it as a springboard to other systems on the

Jim McClary, computer systems security officer for the integrated computing network at Los Alamos said "We weren't aware [of the intrusion] until we started getting calls from systems that this one was probing others."

The backer also used the Los Alamos computer to run a decoding program on encrypted password files stolen from other systems, McClary said.

The break-ins from Los Alamos ended Friday, on March 16, when the laboratory's computer security team

changed the Unix-based system's account codes and passwords.

This sort of break-in "doesn't happen with high frequency, McClary said. "But it's the kind of event we're going to have to expect on the open network."

Purdue University system administrators said they noticed the break-in almost immediately and began monitoring the hacker's attempts to probe computers. After watching the interloper's efforts for two to three weeks, they shut him out permanently, Spafford said.

Stoll said the hacker "had been breaking into computers for about a month [at Harvard]. and we had been setting traps

and monitoring his activities." Last Sunday, just as scientists at the center were preparing to permanently lock out the hack-"somebody broke in and changed the computer banner to read, 'Have Cliff read his mail. The cuckoo has egg on his face,' "Stoll said.

The jibe was a reference to Stoll's book The Cuckoo's Egg, an account of his year-long quest to nab a gang of hackers who repeatedly rifled computer files at several sites on Internet in search of sensitive data that could then be sold to foreign intelligence

Harvard's

Stoll

The unidentified hacker telephoned Stoll last Tuesday to continue taunting him, Stoll said: 'He said that he didn't mean any harm but that he was out to prove a point that not all hackers are bad.

The New York Times said last week it had been contacted by the apparent perpetrator, who said he attacked the systems in an attempt to embarrass those who have spoken disdainfully of outlaw hackers.

The intruder cracked passwords and deleted files to cover his tracks but did not destroy files or cause any damage to any of the systems he attacked.

His initial forays, which start-

ed about a month ago, were discovered almost from the beginning, and his activities had been under constant scrutiny since then, according to Stoll and others whose systems were hit.

"We know an intruder been making persistent attempts on several dozen systems," said a spokesman at the Computer Emergency Response Team (CERT) at Carnegie Mellon University's Software Engineering Institute in Pittsburgh, which tracks computer security breaches on Internet.

However, the spokesman downplayed the significance of the incident and said intruders constantly attempt to enter Internet-attached computers.

Along with CERT, the Department of Energy's year-old Computer Incident Advisory Capability, based at the Lawrence Livermore Laboratory, is involved in the investigation.

Computer security on Internet remains relatively unchanged since Robert T. Morris, the former Cornell University graduate student, shut down thousands of computers with a worm program in early November 1988, said Ian Murphy, a selfstyled professional hacker and president of IAM/Secure Data Systems, a computer security consulting firm in Philadelphia. 'The impact of this incident may help to strengthen security in the areas of the attack, but the rest will remain in Wonderland."

Security

definitions, public relations liabilities and due-care considerations all contribute to this trend," Sherizen added.

Several experts agreed that the prospect of a serious computer security breach causing a company to go bankrupt or harming its employees or customers in some other way is likely to increase.

Distributed information systems and the networks that interconnect them have made corporations more competitive, but at the same time, they have made them more vulnerable to attack by disgruntled employees, hackers and others, they noted. As computer systems are pushed out to end users, the responsibility for securing those systems is also distributed. That responsibility is not necessarily understood or readily accepted by end users, the experts said.

In the event of a computer-security breach that harms an individual or corporation, senior managers, officers and directors are someday going to be held responsible, he said.

According to Randall Miller, executive vice-president and general counsel at Compusource Corp., which markets disaster recovery services through its

Hotsite division, a vice-president or manager of IS can be held personally liable for a catastrophic loss because of a data processing disaster if there are actions that he could have taken to prevent the loss but did not.

There have been numerous court cases in which disgruntled shareholders sued officers, directors and agents for alleged wrongdoing, he said. From these

Agranoff, a Stafford Springs, in computer law.

In other words. . .

What this means in practical terms is that industry does not need to provide meaningful computer security, since it will almost certainly not be liable to persons injured as a result of unauthorized access to computer-

Conn., attorney who specializes

corporation going to its knees an airline, for instance - because of a computer security breach," said Robert Johnston, a manager in information security and business recovery planning at Andersen Con-

sulting in Chicago.

"We're going to have a patchwork quilt approach to computer security until something like that happens," Johnston said.

A handful - Florida and California, for example - have recently passed legislation that would require

state agencies to take measures to adequately protect their computer systems.

Some states also require insurance carriers to adhere to certain security guidelines, but the standards are not uniform definitions vary widely. Iohnston said.

The Computer Security Act of 1987 mandates that federal agencies take adequate steps to secure their computer systems and calls for the National Institute of Standards and Technology (NIST), with assistance from a 12-member panel, to develop computer security guide-

However, arguments

tween NIST and the National Security Agency over who has authority to establish computer security guidelines has stymied efforts to comply with the act. Agranoff added.

"The idea is that such standards and guidelines would permeate to the private sector, as Cobol standards did over 20 vears ago. Agranoff said.

Industry the equivalent of the Department of Defense's trusted computer systems criteria, the so-called Orange Book, ac-

cording to Willis Ware, a corporate research staffer at Rand

Data Security's

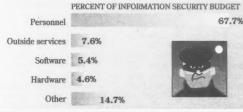

Sherizen

Ware, who heads the advisory board charged with assisting in formulating security standards, confirmed in a speech at the Information Systems Security Association conference in St. Louis last week that the board has made little progress.

"More progress has been made here in 20 minutes," he told the audience, "than in two vears in Washington.

Next week, in the final part of this series. Computerworld will look at computer crimes of the future and their impact on IS security.

cases has come a standard called the "prudent man rule" that requires officers and others to discharge their duties with the diligence and care that ordinary, prudent people would exercise under similar circumstances.

However, there are no generally accepted standards of due care for the protection of computerized data, said Michael

ized data," he said.

Mandatory minimum standards for computer security are inevitable, according to Agranoff and several other experts. The issue is whether those standards will be adopted voluntarily by corporations or foisted upon them by force of law.

"Nothing will be done until there is a disaster such as a major

MARCH 26, 1990

Net clash

databases and shared applications such as Lotus Development Corp.'s Notes.

Several sources agreed that Unix — particularly AT&T's Unix System V, Release 4 currently has a strong lead over OS/2 when it comes to integrated support of popular networking protocols.

However, Delmonte predicted that OS/2 will "give Unix a run for its money" in a couple of years - in plenty of time to be a candidate for the bank's longterm server platform strategy.

Other users cited a problem that should recede as the operating system matures: a lack of backward compatibility between recent versions of OS/2 and earlier versions of its counterpart. Microsoft Corp.'s LAN Manager network operating system.

"If you want to use the most recent version of OS/2 the day it comes out the door with an existing network operating system, vou can't do it." said Bob Holmes, a computer technology research analyst at Southern California Gas.

OS/2's long-term networking strategy will become "clearer by the end of this year," when OS/2 2.0. the "real version," is scheduled to ship, Holmes said.

While vendors such as IBM, Ongermann-Bass, Inc. and 3Com Corp. have fitted OS/2 with a range of communications protocols, it will take time before different vendors' implementations learn to play in harmony.

No cakewalk

"We're finding out that it's not a cakewalk" to integrate and normalize inconsistencies among different vendors' implementations of LAN Manager and the various communications stacks underneath it, said Mark Teflian, vice-president and chief information officer at Covia Partnership.

These things will be fixed, but it could take two years for commercial integration of important server tools, so we're doing it ourselves."

When Covia chose OS/2 Version 2.0 and LAN Manager as the new foundation for its LAN routing and application services, the airline service company knew that a lot of in-house programming would be needed to bridge current gaps in areas such as multivendor communications. administration and security, Teflian said. Covia is now leaning toward Unix as the basis for more powerful hubs that will serve the application and routing needs of entire regions, he added

(see story page 1).

A senior engineer at a large Midwestern utility company, who has decided that his corporate direction for LANs is to implement OS/2 servers on 3Com Corp. 3+Open networks, conceded that Unix is "probably the better choice" for transaction processing environments de-manding a high level of system

Not that OS/2 doesn't have its supporters. One advantage is said to be OS/2 Threads, which is designed to provide a resource-efficient environment for handling multiple on-line trans-actions. "People have been complaining about Unix's lack of threads," Teflian said.

There are smooth OS/2 LAN Manager installations that users are finding tough to criticize. Mike Drips, a systems analyst at United Data Services, has purchased OS/2 1.1 Standard and Extended Editions and is beta testing OS/2 1.2 Extended Edition from IBM with Microsoft's LAN Manager Version 2.0. OS/2, according to Drips, blends the "real-world" business applications found in DOS with the multitasking benefit of Unix.

With OS/2 on a LAN, "We can run four mainframe sessions, cut and paste between the mainframe and the desktop and do incommunication. terprocess Drips said. "I'm having no prob-

Take your pick

or some users, the choice between Unix and OS/2 as server platforms has little to do with the operating systems' networking or file-sharing functionality. Instead, users are choosing on the basis of the following: • Pre-existing server installations. For Covia Partnership, OS/2 was a logical step from an internally developed multitasking version of MS-DOS, which had been the basis for a communications and applications server platform that Covia developed in-house approximately five years ago.

• Pre-existing workstation installation. The U.S. Navy, for example, has sent out a request for proposal (RFP) that does not specifically ask for OS/2 servers but does specify "a LAN that can support existing government-owned workstations, including OS/2 workstations," a Naval Acquisition spokesman said. The only way to meet that specification is with an OS/2 server that supports Named Pipes, according to David Linthicum, a systems manager at Sysorex Information Systems, Inc., a systems integrator that has responded to the REP

 Support of specific types of hardware platforms. Covia is currently leaning toward Unix for a "second-tier" server architecture now being selected because, unlike OS/2, the operating environment will support fault-tolerant computers from Stratus Computer, Inc. and Tandem Computers, Inc., as well as powerful Intel Corp. 80386- and 486-based machines.

• LAN software preferences. One user said, "Our decision was not one of Unix vs. OS/2. We took the approach that, based on a given PC LAN, which LAN server should we use?'

Keeping up to snuff

sers ask, vendors answer. A burgeoning server market may be the reason there have been so many networking-related announcements in the OS/2 and Unix arenas during the past few months. Highlights include the following:

Support of popular networking protocols: January: AT&T announced that Unix System V, Version 4 will have embedded in it Transmission Control Protocol/Internet Protocol (TCP/IP), Sun Microsystems, Inc.'s Remote Procedure Call (RPC) and Network File System, and Open Systems Interconnect (OSI) at an unnamed future date.

January: IBM announced TCP/IP support for OS/2. Other vendors began announcing TCP/IP products for OS/2 about a year

February: IBM announced its intent to support OSI on AIX, having already announced that OS/2 would support OSI. Links into popular network operating systems and ar-

chitectures: September 1989: Hewlett-Packard Co. shipped LAN Manager

for Unix (LM/X) to Microsoft Corp. for distribution to OEMs. February 1989: Novell, Inc. announced Portable Netware, which supports Unix. An OS/2 version of Netware has not been announced vet.

Links into client / server architectures:

February: Digital Equipment Corp. announced that OS/2 will be able to act as a client or server for its Network Application Service. DEC has not made a similar announcement for Ultrix. February: IBM announced that AIX/6000 will support LU6.2, with intent to support the protocol on other AIX systems. Support of distributed computing:

Fall 1989: Vendor alliances responded to Open Software Foundation's formal request for proposals to build a standardized distributed computing environment that would support Unix and other operating systems. A time frame has not been given for delivery of such an environment.

October 1989: Sun, Netwise, Inc. and Novell announced a portable version of Sun's RPC, which will run on LAN Manager as well as other environments. Sun's RPC already runs on Unix.

Support of popular network management protocols: February: IBM announced that AIX will support Simple Network Management Protocol (SNMP), both as a monitoring platform and as a service point to Netview. Fall 1988: IBM announced an OS/2 version of Netview/PC.

October 1989: Sun announced Sunnet Manager, a Unix-based workstation that supports SNMP now and will support OSI and possibly other protocols later.

January: HP announced Openview Network Management Server, an HPUX-based SNMP network management workstation that should eventually run on other types of Unix and support OSI, HP said.

ELISABETH HORWITT

FROM PAGE 1

concentrated in a geographic region, such as San Francisco Bay, '95% of whose information needs can be handled by a single server," Teflian said.

The hubs would reside on the second level of Covia's three-tier server architecture, between the big hosts handling the databases and heavy processing of the large reservation and airport applications and the OS/2 servers residing on individual LANs.

These regional servers will potentially provide several advantages to Covia and its customers. Teflian said. First, the hubs could act as regional communications concentrators. which would eliminate the need to set up a series of individual connections between sites, each supporting a different communications protocol.

Second, unlike the smaller LAN servers, the hubs would have the power to offload critical applications from the big, level one hosts.

A related benefit is that it will be far more economical to implement and manage data integrity and security facilities at a few regional hubs than across a much greater number of widely distributed servers and gateways, Teflian said.

Finally, by providing shared applications and data across multiple user sites, hubs would end the need tor maintaining and managing many redundant versions of the same records, Te-

Covia's Teflian goes regional with servers

flian added.

Covia has pretty much decided that an IBM 370 mainframe's architecture is unsuitable for the hub job, he said. One advantage of using OS/2 as the hub's operating environment is that it

would allow Covia to "push up to the larger-scale server" a suite of communications server applications it originally developed five years ago for a proprietary multitasking version of MS-DOS, and is now porting to OS/2 and LAN Manager, Teflian said.
Unix was not chosen for this

first server platform, he said, because at the time, it did not support such key communications protocols as Netbios and tokenring or host access protocols such as IBM's LU6.2.

However, Unix has since remedied many of its communications omissions. And OS/2 has one big drawback as a hub operating system, Teflian said: The machines it runs on today "are not architected with enough integrity, security, cycle time" to ensure acceptable reliability and response time for critical applications and routing functions.

In contrast, a Unix-based platform would allow Covia to develop services and applications that could run both on powerful Intel Corp. 80386 and 80486 microprocessor platforms and on fault-tolerant systems coming out from vendors such as Stratus Computer, Inc. and Tandem Computers, Inc., according to Teflian.

The company plans to evalu-

Kodak won't push LAN plans

ROCHESTER, N.Y. - Eastman Kodak Co. remains on schedule with its strategy of moving critical applications down from the mainframe to local-area networks by the year 2000.

However, the manufacturer is still at the pilot stage of its LAN project and a long way from settling on specific vendor products to support its strategy.

A prototype human resources LAN system, which Kodak began implementing early last year on a 3Com Corp. OS/2 server, has been put on hold while IS ascertains how to provide users with "boutique-type informaand a recently implemented mainframe-based payroll sys-

tem, according to Henry Pfendt, Kodak's director of information technology services.

Kodak is about six to nine months into the implementation of a pilot project in Spain, which involves moving customer service applications for filling orders and doing bill ing from an IBM

System/36 down to an IBM Personal Computer LAN, Kodak spokeswoman Jean Eason said.

ate the Spain pilot nine months to one year down the road, with an eve toward mi-

Kodak's

Pfendt

grating the PC LAN applications to business environments much larger than the Kodak site in Spain, Pfendt said.

The choice of actual LAN hardware and software prodnots will have to wait while Kodak's business systems creanization does a "complete re-engineering

of fundamental business processes" and evaluates how LAN technology can support those re-

designed processes, Pfendt said. IS is already beginning to do such an evaluation at one U.S.-based business unit he added

Kodak will also need time to work out several key organizational issues, particularly how much of the support, maintenance and management functions to decentralize at the actual business units where LANs reside and how much to centralize at the IBM-operated centers, Pfendt said. "What we would like to have is decentralized operations with centralized control" of critical functions such as backup and recovery, he added.

Kodak expects, at least initially, to keep basic LAN administration and support functions the responsibility of the autonomous business groups, Pfendt said, adding that he does not expect to see the technology "to manage

multiple LANs in an \$18 billion multinational corporation" for at least three to five years.

Kodak's LAN migration effort is unlikely to diminish IBM's responsibility for managing and supporting the manufacturing firm's data centers, because the mainframes' role will not diminish, Pfendt said. While Kodak wants to move the bulk of operations and office applications down to LANs, the mainframes will continue to handle central database files, network management, corporatewide message routing and "computer- and image-intensive applications that require a mainframe environment." he added.

Kodak plans to work with all of its outsourcing partners IBM, Businessland and Digital Equipment Corp. — to address those organizational issues.

HP brings Unix, graphic product plans into view

BY J. A. SAVAGE

Following up its January announcement that it would market a Unix-based fault-tolerant computer using technology from Sequoia Systems, Inc., Hewlett-Packard Co. last week said the system is now available.

HP also announced graphics technology using the new Intel Corp. I860 as a coprocessor and revealed the first step in a strategy to allow its New Wave soft-ware to run on the Unix operating system as well as its current DOS-based Microsoft host, Corp. Windows.

The fault-tolerant machines are only slightly different from Sequoia's current offerings, with some fine-tuning in software such as network communications system ports, which would appeal to the telecommunications industry, said Andy Ingram, marketing manager for HP's fault-tolerant operation.

Pricing, however, is about 5% to 15% higher than comparable Seguoia systems.

The HP Model 1240 is based on Motorola, Inc.'s 68030 processor and can be configured with up to 64 processors. The performance is rated at 20.9 transaction/sec. per processor, according to HP.

The I860-based graphics technology will increase the processing speed and clarity of workstation graphics, HP said. The products, due by the end of the year, would use HP's own architecture and multiple I860 coprocessors. Each I860 has a peak rating of 40 million instructions per second and 80 million floating-point operations per second, according to the organi-

New Wave on Unix

HP also said last week that it will offer a graphical user interface called Visual User Environment (VUE) for HP computers running the Unix operating system. VUE, scheduled for availability in August, resembles the company's New Wave application interface.

It is not yet New Wave on Unix, according to the company, but New Wave capabilities can be added to the VUE shell.

New Wave consists of a graphical user interface, applications development capability and the facility to access standard and proprietary platforms.

3Com may find catching up hard to do

BY JIM NASH

WASHINGTON, D.C. - 3Com Corp.'s introduction of new wide-area bridge and brouter products may signal a shift in emphasis away from work-group systems and toward enterprisewide computing. However, for at least two information systems professionals, the company is playing an unconvincing game of catch-up.

Officials at the Santa Clara. Calif.-based company announced the introduction of its Internetwork Bridge/3000 and the Brouter/3000 with a flourish. The bridge/router, or brouter, can operate as a three-protocol (Transmission Control Protocol/ Internet Protocol, Xerox Network Systems and Open Systems Interconnect) router, an internetwork bridge or a brouter that bridges all other protocols, according to 3Com.

The bridge is priced at \$7,495; the brouter has a price tag of \$7,995.

3Com's move is being billed as a renaissance or, as Chief Executive Officer William Krause put it, "a restart as we get back into this business." Krause said the products, which are part of 3Com's Netbuilder product line, are the first visible results of 3Com's merger with Bridge

Communications three years

Users, however, do not appear ready to rush 3Com's doors for the products, Marc Malacoff, manager of technical support for M. W. Kellogg Co. in Houston, said his department has moved away from its almost exclusive relationship with 3Com. The announcement, Malacoff said, is 3Com's bid in a game of catch.

He said he is "fairly happy" with the Vitalink Communications, Inc. and Retix Corp. bridges that are connecting networks in Louisiana and at other Texas sites

Malacoff criticized 3Com's lack of technical support, citing cooperative marketing agreements offered by Vitalink that include maintenance contracts 3Com does not offer.

Jack Covert, a scientist at the

cessing division of Hughes Aircraft Co. in Long Beach, Calif., was equally unimpressed with the announcement.

They [3Com] fit right in there with the rest of the group," Covert said, referring to Cisco Sytems, Vitalink, Retix and other brouter firms, 3Com's new products appear to match the capabilities of most bridge and brouter devices, he said; only with its prices does 3Com stand out. He said they were "competitive" but not enough to woo him away from his department's Vitalink devices.

According to Covert, band-width exceeding T1 might lure Hughes, but like other major manufacturers, 3Com's products cannot break that limit.

Sterling finally wins out on tossed-out NASA contract

BY JEAN S. BOZMAN

PALO ALTO, Calif. - Sterling Software, Inc.'s Federal Systems group clung to a NASA contract by its fingernails last week - and managed to hold on. At stake was roughly 20% of Sterling's \$180 million revenue stream.

A federal administrative judge ruled that a contract that NASA had twice awarded to Sterling competitor Computer Sciences Corp. (CSC) in El Segundo, Calif., was invalid. Sterling Federal Systems and its corporate predecessor, Informatics, have developed software for NASA's Ames Research Center and operated its supercomputer data center since 1969.

Sterling Federal Systems had fought an 18-month appeal to retain the contract, awarded to CSC on the basis of lower cost in November 1988 and again in October 1989. "We feel we have been vindicated," said Geno To-lari, president of Sterling Federal Systems. "And, despite the lengthy appeals, none of the work was interrupted."

In his ruling, Federal Adminstrative Judge James W. Hendley said CSC had deliberately understated the salary levels of those who would head up the Ames software-development project. NASA. Hendley said. wearing blinders to a contractor's misrepresentations [and] sought to ignore the situation."

NEXT WEEK

A t General Dynamics, the best defense against waste and missed deadlines is a strategy that unites design and manufacturing. Automating the factory floor isn't enough, says Lou Piper, chief CAD/CAM engineer at the Data Systems Division; it takes integration of planning and production to ensure manufacturability. See Executive Report.

Intrepreneurs are not just born, they can be made. With the right attitude, some economic know-how and market savvy, you could be on your way to becoming the next H. Ross Perot. For more detailed instructions on how to become an empirebuilder, check out David Bernard of the Wharton School in the In Depth section.

INSIDE LINES

What goes around, comes around

The Computer Emergency Response Team at Carnegie Mellon University regularly sends out advisories on software patches and security breaches as well as other information to subscribers on its Valert-L electronic-mail hot line. About three weeks ago, it also inadvertently sent out a virus to some 800 subscribers on the mailing list, according to one of CERT's coordinators.

A Toon Town fantasy

Apple insiders say the low-cost Mac (under \$1,000) being worked on deep within the bowels of the company will use the same modular design as the Mac SE. However, producing a color version has been tough because the color tubes are so large. The first color prototype, said one engineer, "wound up looking like a giant forehead."

No worry when the boss steps aside

Charles Darnell, the colorful IS chief at Conyers, Ga.-based Lithonia Lighting, said he plans to retire in three years at age 55 and go into consulting. He said his successor will be second-in-command Jeff Kernan, who joined Lithonia from Pitney-Bowes three years ago as vice-president of information and management services. Darnell has spent his entire 26-year IS career at Lithonia.

Veni, vedi, virus?

According to a top IS security exec at Rockwell International, viruses that target Apple Macintoshes are increasing dramatically and now account for 50% of virus attacks — even though the Macs amount to only 10% of the company's installed base of 20,000 personal computers. "It used to be that viruses hit one, two or three PCs once a month; now it's 40 to hundreds, several times a month," he said.

Bring rotten fruit

Calling all disgusted LAN managers: On April 5, the Hartford Holiday Inn will host the first meeting of the Council for Network (soon to be LAN) Management — or "Veterans of LAN disasters singing the LAN blues," according to Aetna's Rick Segal, one of the group's founders. The council's dual goals are to prod vendors into providing effective LAN management products and to "get the damn Coke cans off the file servers" — that is, help LAN managers avoid making the same old mistakes, Segal said.

Games companies play

The answers being bandied about last week centered on Western Digital, Seagate Technology and an Asian entry — Acer — but, at week's end, the question of which three companies were reportedly bidding to buy beleagured disk drive vendor Miniscribe out of Chapter 11 was left hanging. The name of the guessing game sparked by Miniscribe Chairman Richard Rifenburgh's refusal to specify firms and terms is Jeopardy!, real-life style: Under current court orders, Miniscribe's assets will be auctioned off by a bank if no buyer materializes by next Wednesday.

'You maggots wanna wear pinstripes?'

DEC is reportedly putting an elite corps of high-powered sales folks through two five-week-long "boot camps" where the prevailing theme is, "You're not as good as IBM!" With ex-IBMers conducting sessions from dawn till dusk, the high-stress training actually requires participants over 40 years old to get a doctor's permission before attending, according to one trainee. The final exam? A hard-nosed simulation in which each sales representative must penetrate a Big Blue account and sell something.

How about building a hackers' network for the clowns to play around on and spending the saved manbower lobbying state and federal legislators for effective and stringent security laws and punishments to protect commercial and academic networks? If you've got a workable solution to the crime wave, pass them on to News Editor Pete Bartolik via fax (508-875-8931), phone (800-343-6474) or MCI Mail (address: COMPUTER WORLD) and we'll provide the forum.

Our systems are up. So log in.

Bring us your computer language skills, a talent for communication, and the desire to do something important, and we'll give you an opportunity to make a significant contribution.

Because right now, Boeing Computer Services, a division of The Boeing Company, is looking for the brightest people to help us provide world-class information services to hundreds of commercial and government customers.

We're growing, expanding and doing important work in a broad range of computing disciplines.

So check out the opportunities. If your skills and experience match our requirements, get in touch.

Here's What We Need

The following positions require appropriate industry experience. A degree in CS, EE or ME is desired. Talented entry level engineers and computer specialists with advanced degrees will also be considered.

Applications:

Financial, Manufacturing, Engineering, Logistics, Embedded Software, Expert Systems, CAD/CAM, Neural Networks, Scheduling Systems

Software Packages:

CATIA, McCormick-Dodge, Microsoft Windows, CASE Tools, X Windows, Powerhouse/Trans Act, Artemis, FOCUS

Hardware:

IBM, CRAY, HP, DEC/VAX, Apollo, SUN, TANDEM, WANG/VS

Communications:

LAN, Network Architecture, Novell, X.25, MAP/TOP, Ungerman Bass, Cable Plant Engineer, Protocol Layer Evaluation/Design, Network Hardware

Language Experience: Ada, C, COBOL, FORTRAN, PL/1, SQL, Pascal, Assembler/BAL, 4GL, C++ Operating Systems: MVS, UNIX, CICS, DOS, VMS, NOS, CDS

Database Experience: IMS, DB2, Microrim, Ingres, Paradox, ORACLE

Software Engineering Skills: Data Modeling/Data Management, DOD Standard 2167, System Architecture, Software Testing, Systems Engineering, Capacity Planning/ Performance Tuning, Integration Engineering, Project Management

Operating Systems Analysts: Experience in operating systems of IBM, Digital (8000 series) and HP (3000 and Spectrum series) required.

Factory Automation Software Development:

Integrated OSI communications (MAP/TOP), manufacturing and business operations in a CIM environment which makes exclusive use of multi-vendor platforms (Digital, HP, Intel, LAN & WAN systems).

IMS Programmer Analysts: Experience designing, coding and implementing on-line and batch business systems in an IBM mainframe environment. Proficiency in COBOL, IMS DB-DC, JCL, and TSO/ISPF required. Knowledge and experience with Micro Focus Workbench a plus.

IMS Database Administrators: Command of all IMS databaserelated functions. Performance analysis, space management, problem resolution and logical/physical database design skills are essential.

IBM 8100 Programmer/Analyst: Requires proficiency in use of IBM 8100 hardware and software products. Desirable experience includes DPPX/SP operating system, DPPX/COBOL, DTMS, TSO, CLISTS, host communication facilities and structured programming.

Programmer/Analyst:

Programming experience using Tandem computers, knowledge of

COBOL, SCOBOL, DDL, Inspect, Enable, TMF, Structured Methods, CASE Tools, and Pathways required. SQL and TAL background a plus.

Operating Systems Programmer:

Internals experience in one or more of UNIX, MVS, VMS, NOS, or COS operating systems. Ability to solve system dumps and design new operating system products required.

Here's What We Can Do For You

These positions offer excellent growth potential along with the right salary, relocation assistance and these benefits:

- Company-paid Plans for Health Care, Vision, Dental, Retirement
- Company-sponsored Training Programs (on/off hours)
- Investment Plans (VIP/FSP)
- Continuing Education Program (reimbursable)
- Employee Suggestion & Cost Improvement Programs

We can offer you another plus—a chance to share a quality lifestyle in the beautiful Pacific Northwest. Near Seattle, the number-one ranked city for recreation, and one of the nation's most livable cities, as well.

Here's How To Get In Touch

If you have what it takes to make our team, please send your resume, with current and expected salary, to *Boeing Employment Office, P.O. Box 3707-PDA, Seattle, WA 98124.*

Or fax your resume, in strictest confidence, to our 24-hour fax line: 1-800-525-1036. Principals only.

Please note on your resume which job you are interested in.

We are an equal opportunity employer.

BOEING

INTEGRAL & IBM **Deliver SAA Financial and HRMS Solutions Today**

We Have Answers

Now, when you need them. Because your business' problems can't wait until tomor-

You need integrated solutions that will work across all platforms - mainframe, midrange and PC. Integral is delivering a full, comprehensive line of financial and human resource software that does. And we're delivering it today. Which is exactly what you've come to expect from IBM's premier business partner.

After all, we've delivered more DB2 solutions than all our competitors combined. In fact, IBM awarded us their Outstanding Achievement Award for exceptional performance.

So if you're ready to see what SAA solutions can mean to your company and not just talk about them, as many others do -- come to the Integral/IBM SAA Conference near you or call us today. We're ready to deliver.

INTEGRAL

2185 N. California Blvd. Walnut Creek, CA 94596 800/824-8199 in California 800/824-8198, in Canada 415/939-3900.

Register Now for a Free integral/IBM Conference

SAA is the foundation for the new decade of enterprisewide computing. This free Integral/IBM Conference will give you the information you need to implement SAA solutions safely, efficiently and cost effectively.
